Introduction

For years other than census years, statistics Canada produces **postcensal estimates** of the population by marital status as of June 1. After each census, these estimates are revised in order to provide **intercensal estimates** compatible with the results of the censuses at the beginning and end of the period in question.

This bulletin, the first in a series, contains intercensal estimates of the population by sex and marital status, in quinquennial age groups from 15 years to 90 years and over, as of June 1 of the years 1972 to 1975. The census data of June 1, 1971 and 1976 are also included to facilitate comparisons. Intercensal estimates of the population by marital status for 1966 to 1971 and for 1961 to 1966 have previously been published in the editions of Catalogue 91-203 for the year following a census year (see the References in this publication). Henceforth, Catalogue 91-203 will be devoted solely to the postcensal estimates of the population by marital status.

METHODOLOGY

By definition, intercensal estimates are based on the assumption that the numbers produced are compatible with the data of the two censuses which envelop the period in question. This implies that the trends in the intercensal estimates are also compatible with census data when the population is broken down by marital status, age and sex, regardless of the level of detail being considered.

The methodology which was used to produce these intercensal estimates generated the required compatible results in two stages:

1. First, intercensal estimates were produced by sex and age. For the most part this means that, for each birth cohort, the error observed at the end of the period between the postcensal estimates as of June 1, 1976 and the 1976 Census data, is distributed among the five postcensal estimates for the years 1972 to 1976.1

Introduction

Sauf pour les années de recensement, Statistique Canada produit des estimations postcensitaires de la population selon l'état matrimonial au 1^{er} juin. Après chaque recensement, ces estimations sont révisées dans le but d'obtenir des estimations intercensitaires compatibles avec les résultats des deux recensements encadrant la période considérée.

Le présent bulletin, qui est le premier de sa série, contient les estimations intercensitaires de la population selon le sexe et l'état matrimonial, par groupes d'âges quinquennaux de 15 ans à 90 ans et plus, aux 1^{er} juin des années 1972 à 1975. Les effectifs recensés les 1^{er} juin 1971 et 1976 sont également inclus afin de faciliter les comparaisons. Pour les périodes antérieures à celle de 1971 à 1976, les estimations intercensitaires de la population selon l'état matrimonial paraissaient dans l'édition de la publication nº 91-203 au catalogue qui suivait une année de recensement (voir la section des références). Cette dernière publication (nº 91-203 au catalogue) sera désormais uniquement consacrée aux estimations postcensitaires de la population selon l'état matrimonial.

MÉTHODOLOGIE

Par définition les estimations intercensitaires présupposent que les nombres produits sont compatibles avec les données des deux recensements encadrant la période considérée. Pour les estimations intercensitaires de la population selon l'état matrimonial, l'âge et le sexe, ceci implique que l'évolution des effectifs est aussi compatible lorsque l'on éclate la population selon l'état matrimonial, l'âge et le sexe et ce, quelle que soit la finesse des recoupements.

La méthodologie qui a été utilisée afin de produire ces estimations intercensitaires génère la compatibilité nécessaire en deux étapes.

1. Premièrement, par l'ajustement au niveau du sexe et de l'âge, c'est-à-dire par la production des estimations intercensitaires de la population selon le sexe et l'âge. Dans ses grandes lignes, il s'agissait, pour chaque génération, de répartir l'erreur observée en fin de période entre les estimations postcensitaires au 1er juin 1976 et le recensement de 1976, dans les cinq estimations postcensitaires de la période 1972 à 19761.

¹ For a detailed description of the methodology involved at this stage, consult Revised Annual Estimates of the Population by Sex and Age, for Canada and Provinces 1971-1976, Catalogue 91-518, Statistics Canada, March 1979.

¹ Pour une description détaillée de la méthodologie rattachée à cette étape, on peut consulter Révision des estimations annuelles de la population selon le sexe et l'âge, Canada et provinces, 1971 - 1976, nº 91-518 au catalogue, Statistique Canada, mars 1979.

2. In the second step, marital status categories were assigned to the intercensal numbers which were obtained in the preceding step. This was done in two stages:

by imputing the percentage distribution of the population by marital status for each age and sex group as of June 1 of each year from 1972 to 1975; and,

by applying these percentages to the age-sex estimates which were obtained above, so as to obtain intercensal estimates by age and sex for each marital status category.

For a given sex and age, the following definitions are:

ERt : the number of persons in the census of year t;

jERt : the number of persons of marital status j in the census of year t;

jPRt : the proportion of the population of marital status j in the census of year t;

EIt + i : the number of persons in the intercensal year t + i;

jEIt + i : the number of persons of marital status j in the intercensal year t + i;

jPIt + i : the proportion of the population of marital status j in the intercensal year t + i;

i : marital status:

S = single

M = married

W = widowed

D = divorced.

For each province, the proportional distribution by marital status for each sex and age was calculated for the two census years:

$$_{j}PR^{1971} = _{j}ER^{1971} / ER^{1971}$$
, for $j = S, M, W, D$;
 $_{j}PR^{1976} = _{j}ER^{1976} / ER^{1976}$, for $j = S, M, W, D$.

The proportional distribution for the intercensal years were estimated by apportioning equally over the five years 1971-72 to 1975-76 the five-year trend associated with a given age-sex category.

$$_{j}PI^{1971} + i = _{j}PR^{1971} + \left\{ \frac{i}{5} \cdot (_{j}PR^{1976} - _{j}PR^{1971}) \right\},$$
 for $i = 1$ to 5 and $j = S, M, W, D$.

The intercensal population estimates by marital status were ultimately obtained by breaking down the

2. Deuxièmement, par l'attribution d'états matrimoniaux aux effectifs intercensitaires obtenus à l'étape 1. Ce calcul a été réalisé en deux phases:

pour un âge et un sexe donnés, on a estimé les répartitions en pourcentage de la population suivant l'état matrimonial, aux 1^{er} juin des années 1972 à 1975;

ensuite on a éclaté les estimations produites à l'étape 1 en quatre états matrimoniaux, à l'aide des répartitions estimées ci-dessus.

Soient les définitions suivantes, pour un sexe et un âge donnés:

ERt : l'effectif de la population au recensement de l'année t:

jER^t : l'effectif de la population d'état matrimonial j, au recensement de l'année t;

jPR^t : la proportion de la population qui a l'état matrimonial j, au recensement de l'année t;

EIt + i : l'effectif de la population à l'année intercensitaire

jEI^{t + i} : l'effectif de la population d'état matrimonial j, à l'année intercensitaire t + i;

jPI^{t + i} : la proportion de la population qui a l'état matrimonial j, à l'année intercensitaire t + i;

i : l'état matrimonial;

C = célibataire

M = marié

V = veuf

D = divorcé.

Pour chaque province, pour chaque sexe et année d'âge, nous avons calculé les répartitions proportionnelles des effectifs suivant leur état matrimonial, aux deux années de recensement:

$$_{j}PR^{1971} = _{j}ER^{1971} / ER^{1971}$$
, pour $j = C, M, V, D;$
 $_{j}PR^{1976} = _{j}ER^{1976} / ER^{1976}$, pour $j = C, M, V, D.$

Les répartitions proportionnelles des années intercensitaires ont été estimées en distribuant uniformément sur les cinq années 1971 - 72 à 1975 - 76 le mouvement quinquennal des répartitions associées à un âge et un sexe donnés.

$$_{j}PI^{1971} + i = _{j}PR^{1971} + \left\{\frac{1}{5} \cdot (_{j}PR^{1976} - _{j}PR^{1971})\right\},$$

pour $i = 1$ à 5
et $j = C, M, V, D$.

Les effectifs intercensitaires de la population selon l'état matrimonial ont été obtenus finalement en éclatant les intercensal figures for a given age and sex (published in Catalogue 91-518) using proportions ¡PIt + i:

$$_{j}EI1971 + i = EI1971 + i \cdot _{j}PI1971 + i$$
, for $i = 1$ to 5 and $j = S, M, W, D$.

HIGHLIGHTS

As of June 1, 1976, there were 17,096,425 persons or 74.4% of Canada's total population 15 years of age and over, compared with 15,187,415 or 70.4% as of June 1, 1971. The large increase in the relative importance of this group stems from the fact that it increased during the intercensal period by 1,909,010, or 12.6%, while the number of persons under 15 years of age decreased by 484,720, or -7.6%. This can be largely explained by the decline in the birth rate during the last 15 years.

According to the June 1, 1976 Census, there were 8,429,510 males 15 years of age and over of which 31.4% were single, 64.9% were married, 2.3% were widowed and 1.4% were divorced. There was a slightly higher number of females (8,666,915) in the same age group who were enumerated in the 1976 Census, of which 24.6% were single, 63.5% were married, 9.9% were widowed and 2.1% were divorced. This distribution differs only slightly from the data for the 1971 Census. The percentage of single and of widowed males dropped in both cases by 0.2%, whereas the percentage of divorced males increased by 0.4%. The percentage of single and of married females decreased in both cases by 0.4%, while that of divorced females increased by 0.8% (Text Table I).

Between June 1, 1971 and June 1, 1976, the number of divorced persons increased by 82.1% among females and by 60.1% among males. The number of widows increased by 13.4% while the number of widowers decreased by 0.8%. The number of married females increased by 12.5% and married males by 12.0%. At the same time, the number of single persons increased by 11.3% for both males and females.

Marital Status and Age Group

Table 2 (page 40) shows the proportion of single, married, widowed and divorced persons in Canada by age group and sex in 1971 and 1976. During this period, for both sexes and in almost all age groups, there was a decrease in the proportion of single persons and widowed persons and an increase in the proportion of divorced persons. The most notable exceptions were the increase in the proportion of single males and females in the 20 to 29 age groups, and the increase in the proportion of widows over 75

effectifs intercensitaires d'un âge et d'un sexe donnés (parus dans le nº 91-518 au catalogue) à l'aide des proportions ¡PIt + i:

$$\begin{split} {}_{j}EI^{1971}+i &= EI^{1971}+i \cdot {}_{j}PI^{1971}+i \ , \\ pour &i=1 \text{ à 5} \\ et &j=C,M,V,D. \end{split}$$

TRAITS SAILLANTS

Au 1^{er} juin 1976, 17,096,425 personnes étaient âgées de 15 ans et plus, soit 74.4 % de la population totale du Canada, comparativement à 15,187,415 ou 70.4 % au 1^{er} juin 1971. Cette forte hausse du poids des 15 ans et plus provient du fait que leur nombre a augmenté au cours de la période intercensitaire de 1,909,010 (ou 12.6 %) tandis que l'effectif de la population âgée de moins de 15 ans a diminué de 484,720 (ou - 7.6 %). Cette dernière situation s'explique surtout par la baisse de la natalité depuis les 15 dernières années.

Le recensement du 1^{er} juin 1976 a dénombré 8,429,510 hommes âgés de 15 ans et plus dont 31.4 % de célibataires, 64.9 % de mariés, 2.3 % de veufs et 1.4 % de divorcés. Le nombre de femmes de 15 ans et plus recensées à cette même date est légèrement plus élevé, soit 8,666,915 dont 24.6 % de célibataires, 63.5 % de mariées, 9.9 % de veuves et 2.1 % de divorcées. Par rapport aux données du recensement de 1971, ces répartitions n'ont que très légèrement changé. Pour les hommes, les pourcentages de célibataires et de veufs ont diminué de 0.2 % au profit du pourcentage de divorcés qui a augmenté de 0.4 %. Pour les femmes, les pourcentages des célibataires et de mariées ont diminué de 0.4 % et celui des divorcées a augmenté de 0.8 % (tableau explicatif I).

Entre les 1er juin 1971 et 1976, les effectifs de divorcés ont augmenté de 82.1 % chez les femmes et de 60.1 % chez les hommes. Le nombre de femmes en veuvage s'est accru de 13.4 % tandis que chez les hommes il y a eu diminution de 0.8 %. Pour les mariés, on a enregistré des augmentations de 12.5 % chez les femmes et 12.0 % chez les hommes. Enfin les effectifs de célibataires se sont accrus de 11.3 % chez les hommes et chez les femmes.

État matrimonial et groupe d'âges

Le tableau 2 (page 40) présente pour le Canada, les proportions de célibataires, mariés, veufs et divorcés selon le groupe d'âges et le sexe, en 1971 et 1976. Au cours de cette période, on enregistre dans les deux sexes et à presque tous les groupes d'âges, une diminution de la proportion de célibataires, une diminution de la proportion de veufs et une augmentation de la proportion de divorcés. Les deux exceptions les plus remarquées sont l'augmentation des proportions des hommes et des femmes célibataires chez les 20 à 29 ans, et l'augmentation de la proportion de veuves au-dessus de 75 ans. Pour les

years of age. The trends among married persons were much less uniform. There was an increase in the proportion of married females in the age groups 15 to 19 and 50 to 74 years and a decrease in the age groups 20 to 49 and 75 and over. The proportion of married males increased in the age groups 35 to 49 and 55 and over while it decreased in the age groups 25 to 34 and 50 to 54 years. Figure I shows the trends in the proportion of single, married, widowed and divorced persons by age group and sex as of June 1, 1976.

mariés, l'évolution des proportions est beaucoup moins monolithique. On note une augmentation des proportions de femmes mariées dans les groupes d'âges 15 à 19 ans et 50 à 74 ans et une diminution dans ceux de 20 à 49 ans et 75 ans et plus. Chez les hommes mariés, les proportions ont augmenté dans les groupes d'âges 35 à 49 ans et 55 ans et plus tandis qu'elles ont diminué dans ceux de 25 à 34 ans et 50 à 54 ans. À la figure I, on peut comparer l'évolution selon le groupe d'âges et le sexe, des proportions de célibataires, mariés, veufs et divorcés au 1^{et} juin 1976.

TEXT TABLE I. Distribution of Males and Females by Marital Status, and Change in the Numbers from 1971 to 1976, Canada, 1971 and 1976 Censuses

Sex Ratio

The sex ratios in Table 3 show the disparities between the number of males and females within the marital status category.

There were 124.3 single males for every 100 single females in the population 15 years of age and over as of June 1, 1976. This large proportion of males stems mainly from the fact that among single

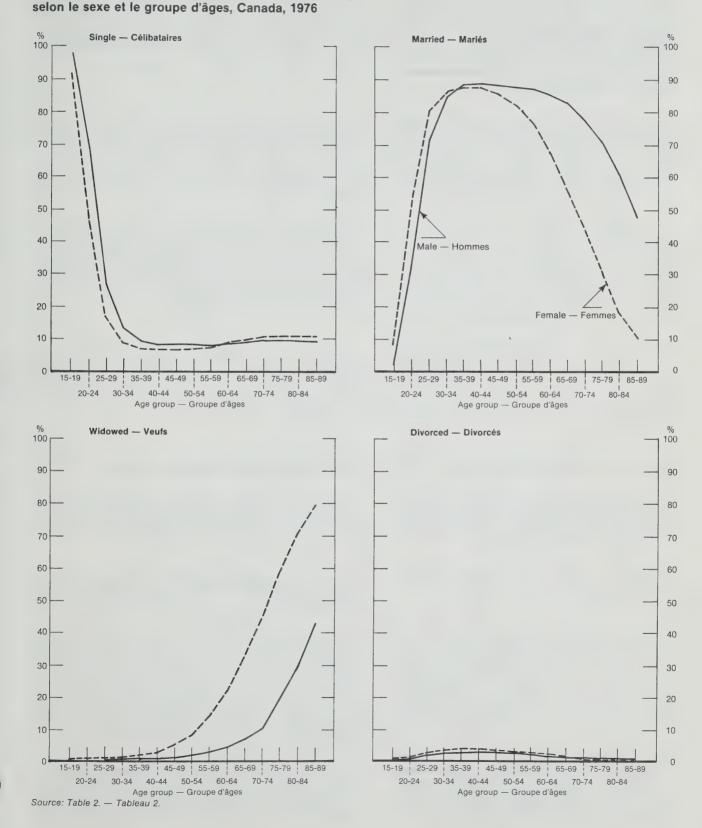

Les rapports de masculinité

Les rapports de masculinité du tableau 3 font voir l'ampleur des inégalités qui existent entre les effectifs masculins et féminins au sein d'un même état matrimonial.

Parmi la population âgée de 15 ans et plus, on comptait au 1^{er} juin 1976 124.3 hommes célibataires pour 100 femmes célibataires. Cette forte proportion d'hommes vient surtout du fait que chez les célibataires, avant 30 ans, les

Proportions of Single, Married, Widowed and Divorced by Sex and Age Group, Canada, 1976

Proportions de célibataires, mariés, veufs et divorcés,

persons less than 30 years of age, females on the average marry at an earlier age and in a higher proportion than do males. Even though after age 30 single males have higher marriage and mortality rates than females, it is only after age 55 when there are more single women than men (see Figure II). Beyond that age, the number of single persons is so small that the larger number of females in these older age groups cannot compensate for the larger number of males among persons under 30 years of age.2

Among the married population, the total number of males and females was practically equal, at 99.5 males for every 100 females. However, the sex ratios for the youngest and oldest age groups are far from equal (25:100 in the 15 to 19 age group and 274:100 in the 85 to 89 age group).

The ratios are very low among the widowed at all ages. The average ratio is 22.2 males for every 100 females. This can be attributed not only to the higher death rate among males, but also to the fact that on the average females marry at an earlier age than their husbands, and that after widowhood they have a lower rate of remarriage than men.

The sex ratio of divorced persons for all ages is 64.9:100. Here also, this low ratio can be attributed to the fact that divorced females have a lower rate of remarriage than divorced males, and that there is an age difference between spouses and to the higher death rate for males.

RELIABILITY OF THE ESTIMATES

The estimates in this publication are subject to a certain margin of error, some of which stem from errors in census data and some of which stem from the estimation methodology employed.

Errors from census figures include coverage errors and response and processing errors.

Coverage errors are mainly caused by underenumeration. Since over-enumeration is fairly rare, it is considered negligible. In Canada, the total undercoverage rate was practically the same in the 1971 and 1976 Censuses, about 2%. However, Text Table II shows that it was unevenly distributed by marital status. femmes se marient en moyenne plus jeunes et en proportion plus élevée que les hommes de ce groupe d'âges. Même si après 30 ans les hommes célibataires ont des taux de mariage et de mortalité supérieurs à ceux des femmes, ces taux ne réussissent pas à compenser avant 55 ans le retard déjà acquis (voir la figure II). Au delà de cet âge, les effectifs mis en cause sont alors si petits qu'ils ne font pas le poids devant ceux mis en cause avant 30 ans².

À la même date, les nombres totaux d'hommes et de femmes mariés étaient pratiquement égaux, 99.5 hommes pour 100 femmes. On peut cependant voir qu'aux deux extrémités d'âge, les rapports de masculinité sont loin du point d'équilibre (25: 100 chez les 15 à 19 ans et 274: 100 chez les 85 à 89 ans).

Chez les veufs on note des rapports très faibles à tous les âges, en moyenne 22.2 hommes pour 100 femmes. On peut attribuer cela non seulement à la surmortalité masculine, mais aussi au fait que les femmes sont en moyenne plus jeunes que leur mari et ont un taux de remariage suite au veuvage inférieur à celui des hommes.

Le rapport de masculinité tous âges des divorcés est de 64.9:100. Ici aussi, cette faible masculinité peut être attribuée au fait que les divorcées ont des taux de remariage inférieurs aux divorcés, au décalage d'âge entre les époux et à la surmortalité masculine.

LIMITATIONS DES NOMBRES ESTIMÉS

Les nombres contenus dans la présente publication sont entachés d'une certaine marge d'imprécision qui provient à la fois des erreurs dues aux données des recensements et des erreurs dues aux méthodologies d'estimation.

Les erreurs provenant des chiffres des recensements comprennent des erreurs de couverture et des erreurs de réponse et d'exploitation.

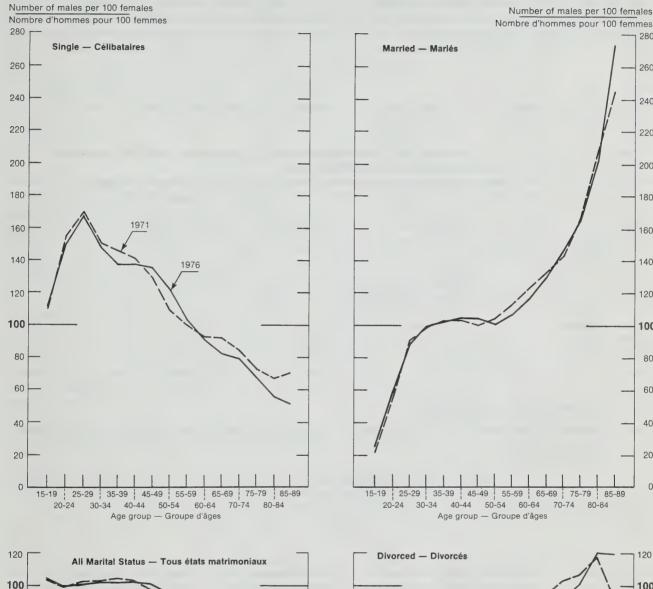

Les erreurs de couverture sont principalement causées par un sous-dénombrement. Le surdénombrement étant assez rare, il est considéré comme négligeable. Au niveau du Canada, le taux global du sous-dénombrement fut pratiquement le même dans les recensements de 1971 et 1976, environ 2 %. Le tableau explicatif II montre que le sous-dénombrement était cependant inégalement réparti selon l'état matrimonial.

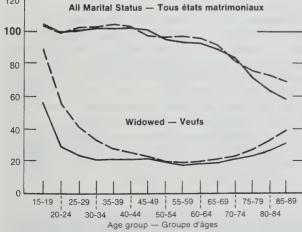

² For further information on differences in marriage rates by marital status and sex, see K.G. Basavarajappa, Marital Status and Nupriality in Canada, Statistics Canada, 1971 Census of Canada, Profile Studies: Demographic Characteristics, Catalogue 99-704, Ottawa, 1978.

Statistique Canada, Recensement du Canada de 1971, Études schématiques: Caractéristiques démographiques, n° 99-704 au catalogue. Ottawa, 1978.

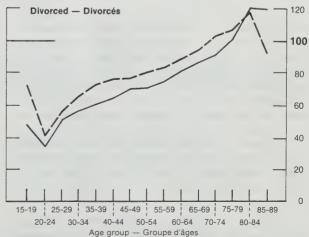

Figure - II Sex Ratio by Marital Status and Age Group, Canada, 1971 and 1976

Rapport de masculinité selon l'état matrimonial et le groupe d'âges, Canada, 1971 et 1976

Source: Table 3. - Tableau 3.

The main response and processing errors stem from non-responses, misinterpretation of questions by the respondents and coding and imputation errors. The response rate for the 1976 Census question on age was 98.4%, on marital status 98.0% and on sex 98.6%. For further detail on the total standard error associated with census figures, the publications listed in the bibliography may be consulted.

Les principales erreurs de réponse et d'exploitation proviennent des non-réponses, des interprétations erronées de la part des recensés, du codage et de l'imputation. Les taux de réponse aux questions du recensement de 1976 ont été de 98.4 % pour l'âge, 98.0 % pour l'état matrimonial et 98.6 % pour le sexe. Pour plus de détails sur l'erreur type totale des chiffres des recensements, on peut se référer aux publications citées dans la section bibliographique.

Although it is difficult to measure the significance of the errors which stem from the estimation methods and from data sources other than the censuses, they probably are not negligible. At each level of detail additional inaccuracy is introduced. The intercensal population estimates by sex and age themselves contain errors, and the method which was used to attribute marital status categories to them adds a new source of error. The significance of this error is certainly greater in age groups where the distribution by marital status varies markedly (for example, ages 15 to 34) than in age groups where it is fairly stable (for example, ages 35 to 54).

Finally, the accuracy of the figures is also affected by the very definition of marital status. In Canadian censuses, all persons living in common-

Les erreurs provenant des sources de données autres que les recensements et des méthodologies d'estimation ont une importance difficilement quantifiable mais qu'on ne peut négliger. À chaque niveau de ventilation se glisse un nouveau coefficient d'imprécision. Les effectifs intercensitaires de la population selon le sexe et l'âge contiennent une certaine erreur de départ. La méthodologie que nous avons utilisée pour leur attribuer des états matrimoniaux ajoute aux nombres ainsi obtenus une nouvelle source d'erreur. L'importance de cette dernière erreur est sûrement plus grande aux âges où la répartition selon l'état matrimonial varie rapidement (par exemple, 15 à 34 ans) qu'aux âges où elle est plutôt stable (par exemple, 35 à 54 ans).

Une dernière limitation des nombres provient de la définition même de la variable état matrimonial. Dans les recensements du Canada, sont aussi considérées comme mariées

law arrangements are considered to be married.3 The estimates contained in the present publication employ the same definition. There is reason to believe that this practice causes a significant transfer to the married category from other marital status categories. For example, there were 74,355 divorced males in Canada as of June 1, 1971. Although the occurrence of demographic events between June 1, 1971 and June 1, 1976 would lead one to expect a total of approximately 170,0004 divorced males as of June 1, 1976, there were only 119,035 such persons enumerated in the 1976 Census.

DEFINITIONS

Population

Estimated population and population according to the census are both defined as being "the total number of persons whose usual place of residence . . . was somewhere in Canada, including Canadian government employees stationed abroad and their families, members of Canadian Armed Forces stationed abroad and their families, and crews of Canadian merchant vessels. Not included are government representatives of other countries and their families, attached to the legation, embassy, or other diplomatic body of that country, members of the Armed Forces of other countries stationed in canada and members of their families who are not citizens of Canada, students attending school in Canada whose usual residence is outside Canada, and residents of another country visiting in Canada temporarily". (Dictionary of the 1971 Census Terms, Catalogue 12-540, page 28.)

Postcensal Estimate

Population estimate produced by using data from the most recent census and estimates of the components of demographic change since that last census date.

Intercensal Estimate

Population estimate derived by using data from the censuses preceding and following the year in question.

Error of Closure

Difference between the population according to a census and the updated postcensal estimate for the same date. toutes les personnes vivant en union consensuelle³. Dans les estimations contenues dans le présent bulletin, nous utilisons cette même définition. On a lieu de croire que cette politique entraîne cependant des transferts non négligeables des autres états matrimoniaux vers l'état de marié. Par exemple, au 1^{er} juin 1971 il y avait au Canada 74,355 hommes divorcés. Alors que le compte des événements démographiques, entre les 1^{er} juin 1971 et 1976, affectant cette population en laissait attendre près de 170,000⁴ au 1^{er} juin 1976, le recensement de 1976 en a dénombré 119,035.

DÉFINITIONS

Population

La population estimée répond à la même définition que celle dénombrée lors du recensement. Il s'agit donc du "nombre total de personnes dont le lieu de résidence habituelle . . . était quelque part au Canada, y compris les employés du gouvernement canadien postés à l'étranger et leur famille, les membres des Forces armées canadiennes stationnés à l'étranger et leur famille et les équipages des navires marchands canadiens. Ne sont pas compris les représentants officiels des autres pays et leur famille, attachés à la légation, à l'ambassade ou à un autre organisme diplomatique de ces pays, les membres de Forces armées étrangères stationnés au Canada et les membres de leur famille qui ne sont pas citoyens du Canada, les étudiants qui fréquentent l'école au Canada mais dont la résidence habituelle est en dehors du Canada et les résidents d'autres pays en visite temporaire au Canada". (Dictionnaire des termes du recensement de 1971, no 12-540 au catalogue, page 22.)

Estimation postcensitaire

Estimation de l'effectif de la population obtenue en utilisant les résultats du dernier recensement disponible et l'estimation des composantes du changement démographique survenu depuis la date de ce dernier recensement.

Estimation intercensitaire

Estimation de l'effectif de la population obtenue en tenant compte des résultats des deux recensements encadrant l'année considérée.

Erreur en fin de période intercensitaire

Différence entre la population donnée par un recensement et l'estimation postcensitaire corrigée à la date du recensement.

³ Statistics Canada, "1971 Census of Canada, Instruction Booklet"

⁴ Unpublished postcensal estimates as of June 1, 1976.

³ Statistique Canada, "Recensement du Canada de 1976, Livret d'instructions".

⁴ Estimations postcensitaires au 1^{er} juin 1976, non publiées.

Undercoverage Rate

The ratio, expressed in percentage, of the number of persons not enumerated in the census (who were intended to have been enumerated in that census) to the total number that should have been enumerated in the census.

Sex Ratio (or Masculinity, Ratio)

The ratio of the number of men to the number of women. This is not to be confused with the sex ratio at birth, which is the ratio of the number of live boys born to the number of live girls born. This ratio is usually expressed as an index, with the number of women taken to be a base of 100.

Marital Status

Indicates the conjugal status, that is, whether single, married widowed or divorced. Please note that:

Single. Includes persons who have never been married and all persons under 15 years of age.

Married. Includes persons now married, separated (legally or otherwise) persons who are not divorced and persons living in common-law unions.

Taux de sous-dénombrement

Rapport, exprimé en pourcentage, du nombre des personnes qui n'ont pas été recensées (mais étaient visées par le recensement) à celui de l'ensemble des personnes visées par le recensement.

Rapport de masculinité

Rapport de l'effectif du sexe masculin à l'effectif du sexe féminin. Le rapport de masculinité à la naissance désigne le rapport des naissances masculines aux naissances féminines. On exprime généralement ce rapport comme un indice, l'effectif du sexe féminin étant pris pour base 100.

État matrimonial

Indique la situation conjugale, c'est-à-dire célibataire, marié, veuf et divorcé. Il convient de signaler que:

Célibataire. Comprend les personnes qui n'ont jamais été mariées et toutes les personnes de moins de 15 ans.

Marié. Comprend les personnes actuellement mariées, les personnes séparées légalement ou non mais qui n'ont pas obtenu de divorce et les personnes vivant en union consensuelle.

REFERENCES

Estimates for intercensal periods prior to 1971 to 1976 have been published in the following publications:

1966 to 1971. Population Estimates by Marital Status, Age and Sex for Canada and Provinces 1972, Catalogue 91-203, published in June 1974.

1961 to 1966. Population Estimates by Marital Status, Age and Sex for Canada and Provinces, 1967, Catalogue 91-203, published in June 1969.

1956 to 1961, Unpublished, available on request.

1951 to 1956. Unpublished, available on request.

1941 to 1951. Population Estimates by Marital Status, Age and Sex for Canada and Provinces 1952, Catalogue 6003-504, published in April 1954.

1931 to 1941. Estimated Population of Canada and Provinces, by Marital Status and Sex, 1931-1945, Catalogue 7-9010, published in 1947.

Reference publications providing information on the methods used to produce the intercensal estimates:

Total population. Estimates of Population for Canada and the Provinces, June 1, 1977, Statistics Canada, Catalogue 91-201, November 1977.

Population by sex and age. Revised Annual Estimates of the Population by Sex and Age for Canada and the Provinces, 1971-1976, Statistics Canada, Catalogue 91-518, March 1979.

Reference publications on definitions and measures of reliability of census figures.

1971 Census. Introduction to Volume I (Part 4), Population, 1971 Census of Canada, Statistics Canada, Catalogue 92-729, 1976.

1976 Census. *Marital Status by Age Group*, Population, 1976 Census of Canada, Statistics Canada, Catalogue 92-825, 1978.

RÉFÉRENCES

Les estimations intercensitaires des périodes antérieures à celle de 1971 à 1976 sont parues dans les publications suivantes:

1966 à 1971. Estimations de la population suivant l'état matrimonial, l'âge et le sexe, Canada et provinces, 1972, nº 91-203 au catalogue, parue en juin 1974.

1961 à 1966. Estimations de la population suivant l'état matrimonial, l'âge et le sexe, Canada et provinces, 1967, nº 91-203 au catalogue, parue en juin 1969.

1956 à 1961. Non publiées, disponibles sur demande.

1951 à 1956. Non publiées, disponibles sur demande.

1941 à 1951. Estimations de la population selon l'état matrimonial, l'âge et le sexe, Canada et provinces, 1952, nº 6003-504 au catalogue, parue en avril 1954.

1931-1941. Population estimative du Canada et des provinces, selon le sexe et l'état conjugal, 1931-1945, nº 7-9010 au catalogue, parue en 1947.

Publications de référence portant sur les méthodologies utilisées pour produire les estimations intercensitaires:

Population totale. Estimation de la population du Canada et des provinces, 1er juin 1977, Statistique Canada, nº 91-201 au catalogue, novembre 1977.

Population selon le sexe et l'âge. Révision des estimations annuelles de la population selon le sexe et l'âge, Canada et provinces, 1971-1976, Statistique Canada, nº 91-518 au catalogue, mars 1979.

Publications de référence portant sur les définitions et les mesures de fiabilité des chiffres des recensements:

Recensement de 1971. Introduction au volume I (partie 4), Population, Recensement du Canada de 1971, Statistique Canada, nº 92-729 au catalogue, 1976.

Recensement de 1976. État matrimonial par groupe d'âge, Population, Recensement du Canada de 1976, Statistique Canada, nº 92-825 au catalogue, 1978.

Intercensal annual estimates of population by marital status, age and sex for Canada and the provinces

1976-1981

Estimations intercensitaires annuelles de la population suivant l'état matrimonial, l'âge et le sexe, Canada et provinces

1976-1981

Data in Many Forms...

Statistics Canada disseminates data in a variety of forms. In addition to publications, both standard and special tabulations are offered on computer printouts, microfiche and microfilm, and magnetic tapes. Maps and other geographic reference materials are available for some types of data. Direct access to aggregated information is possible through CANSIM, Statistics Canada's machine-readable data base and retrieval system.

How to Obtain More Information

Inquiries about this publication and related statistics or services should be directed to:

Population Estimates Section, Demography Division,

Statistics Canada, Ottawa, K1A OT7 (Telephone: 995-2213) or to the Statistics Canada reference centre in:

St. John's	(772-4073)	Sturgeon Falls	(753-4888)
Halifax	(426-5331)	Winnipeg	(949-4020)
Montréal	(283-5725)	Regina	(359-5405)
Ottawa	(992-4734)	Edmonton	(420-3027)
Toronto	(966-6586)	Vancouver	(666-3691)

Toll-free access is provided in all provinces and territories, for users who reside outside the local dialing area of any of the regional reference centres.

How to Order Publications

This and other Statistics Canada publications may be purchased from local authorized agents and other community bookstores, through the local Statistics Canada offices, or by mail order to Publication Sales and Services, Statistics Canada, Ottawa, K1A OV7.

Des données sous plusieurs formes...

Statistique Canada diffuse les données sous formes diverses. Outre les publications, des totalisations habituelles et spéciales sont offertes sur imprimés d'ordinateur, sur microfiches et microfilms et sur bandes magnétiques. Des cartes et d'autres documents de référence géographiques sont disponibles pour certaines sortes de données. L'accès direct à des données agrégées est possible par le truchement de CANSIM, la base de données ordinolingue et le système d'extraction de Statistique Canada.

Comment obtenir d'autres renseignements

Toutes demandes de renseignements au sujet de cette publication ou de statistiques et services connexes doivent être adressées à:

Section des estimations démographiques, Division de la démographie,

Terre-Neuve et Labrador

Statistique Canada, Ottawa, K1A DT7 (téléphone: 995-2213) ou au centre de consultation de Statistique Canada à:

St. John's	(772–4073)	Sturgeon Falls	(753-4888)
Halifax	(426-5331)	Winnipeg	(949-4020)
Montréal	(283-5725)	Regina	(359-5405)
Ottawa	(992-4734)	Edmonton	(420-3027)
Toronto	(966-6586)	Vancouver	(666-3691)

Un service d'appel interurbain sans frais est offert, dans toutes les provinces et dans les territoires, aux utilisateurs qui habitent à l'extérieur des zones de communication locale des centres régionaux de consultation.

INTRODUCTION

Every five years, the census provides information on the age, sex and marital status of the Canadian population. However, many people find they need yearly figures for their purposes. For this reason, Statistics Canada produces postcensal estimates, based on the latest census data and demographic data collected each year. These postcensal estimates are inexact: they are amended as soon as a new census is taken. Thus, the revised or intercensal estimates as they are now called, are compatible with data from the censuses at either end of the five-year period.

This bulletin contains intercensal estimates of marital status as of June 1, 1977 to 1980. Estimates were derived for each year of age from 15 to 44 and in five-year groupings from 45 to 90. For easy comparison, actual data from the 1976 and 1981(1) censuses are also provided.

Like all estimates, figures in this bulletin are subject to a certain margin of error. An explanation of methods used in estimating data follows for users interested in examining the extent and sources of these errors. In addition, a reference list provides intercensal estimates of marital status prior to 1976 and other related estimates produced by Statistics Canada.

- (1) The June 3, 1981 Census data were adjusted to represent the June 1, 1981 data.
- NOTE: From 1982 on, the publication Catalogue No. 91-203, "Postcensal Estimates of Population by Marital Status, Age and Sex" will be discontinued. The estimates will appear in a new publication, Catalogue No. 91-210.

Tous les cinq ans, le recensement de la population canadienne fournit l'information relative à plusieurs de ses caractéristiques telles que l'âge, le sexe et l'état matrimonial. Quantité de gens éprouvent toutefois, en la matière, le besoin de données annuelles. Statistique Canada produit donc des estimations de la population, pour chacune des années postérieures à un recensement, au moyen des résultats de celui-ci et de données démographiques recueillies annuellement. Incertaines, ces estimations postcensitaires sont révisées au recensement suivant. Elles deviennent ainsi des estimations intercensitaires, compatibles avec les résultats des deux recensements encadrant les années pour lesquelles on désire connaître l'état de la population.

La présente publication contient les estimations intercensitaires de la population selon l'état matrimonial, au premier juin des années 1977 à 1980. Elles ont été obtenues pour chaque année de vie comprise entre 15 à 44 ans et par intervalle de cinq années pour les individus âgés de 45 à 90 ans et plus. Facilitant les comparaisons, les données exactes des recensements de 1976 et 1981(1) sont également fournies.

Comme toute estimation, les chiffres contenus dans cette publication sont entachés d'une certaine marge d'imprécision. Aux pages suivantes, l'explication des méthodes employées pour obtenir de telles données permettra à l'utilisateur intéressé de mieux en connaître l'étendue et les causes. Une liste des ouvrages de référence a également été dressée à l'intention de ceux qui désireraient, pour les années antérieures à 1976, les estimations intercensitaires de la population selon l'état matrimonial ou les différentes estimations démographiques connexes établies par Statistique Canada.

- (1) Les données du recensement du 3 juin 1981 ont été ajustées au 1^{er} juin 1981.
- NOTA: À compter de 1982, les estimations postcensitaires de la population suivant l'état matrimonial, l'âge et le sexe, paraîtront dans une nouvelle publication n⁰ 91-210 au catalogue. La publication 91-203 au catalogue est donc discontinuée.

HIGHLIGHTS

On June 1, 1981, 18,860,150 persons or 77.5% of Canada's total population were 15 years of age and over, compared with 17,096,425 or 74.4% on June 1, 1976. The adult portion of the population increased by 1,763,725 or 10.3% during the intercensal period, while those under 15 decreased by 414,630 or -7.0%. This decline reflects the falling birth rate during the last 20 years.

As of June 1, 1981, there were 9,256,260 males 15 years of age and over: 31.3% were single, 64.3% were married, 2.2% were widowed and 2.2% were divorced. There were slightly more adult females than males (9,603,895): 24.5% were single, 62.4% were married, 10.0% were widowed and 3.1% were divorced.

Between June 1, 1976 and June 1, 1981, the number of divorced persons increased by 62.0% for females and by 70.4% for males. The number of widows increased by 12.2%, while the number of widowers rose by only 5.2%. The number of married females increased by 9.0% and married males by 8.8%. At the same time the number of single persons increased by 9.5% for males and by 10.6% for females (Text Table I).

Marital Status and Age Group

Table 7 and Figure I show the proportion of single, married, widowed and divorced persons in Canada by sex in five-year age groups for 1976 and 1981.

During this period, the most notable change is a shift of population from married to divorced, for both sexes and every age group. Among population 15 years and over, proportions of single and widowed remained virtually the same in 1976 and 1981, at 31.4% and 31.3% for males and 24.6% and 24.5% for females.

Under 40 years of age, however, the proportion of single persons increased for males and females. The increase was substantial for those aged 20 to 29. After 40, the proportion of single persons dropped for both sexes in every age group.

The reverse was true for the married population. Their proportions were lower in 1981 than in 1976 for every age group to age 55-59 for males and 50-54 for females. After these ages, the proportion was higher in 1981 than in 1976.

FAITS SAILLANTS

Au 1^{er} juin 1981, 18,860,150 Canadiens étaient âgés de 15 ans ou plus, soit 77.5% de la population totale, comparativement à 17,096,425 ou 74.4% au 1^{er} juin 1976. Le nombre d'adultes a augmenté de 1,763,725 (+10.3%) au cours de la période intercensitaire, alors que celui des moins de 15 ans a diminué de 414,630 (-7.0%). Ce déclin s'explique par la baisse du taux de natalité au cours des 20 dernières années.

Au 1er juin 1981, la population comptait 9,256,260 hommes de 15 ans ou plus, dont 31.3% étaient célibataires, 64.3% mariés, 2.2% veufs et 2.2% divorcés. Dans ce groupe d'âges, les femmes étaient légèrement plus nombreuses que les hommes (9,603,985) et 24.5% étaient célibataires, 62.4% mariées, 10.0% veuves et 3.1% divorcées.

Entre le 1^{er} juin 1976 et le 1^{er} juin 1981, l'effectif des personnes divorcées a augmenté de 62.0% chez les femmes et de 70.4% chez les hommes. Le nombre de veuves a progressé de 12.2%, alors que celui des veufs n'a avancé que de 5.2%. Le nombre de femmes mariées a gagné 9.0% et celui des hommes mariés, 8.8%. Enfin, l'effectif des célibataires s'est accru de 9.5% chez les hommes et de 10.6% chez les femmes (le tableau explicatif I).

État matrimonial et groupe d'âges

Le tableau 7 et la figure I présentent, pour le Canada, les proportions de personnes célibataires, mariées, veuves et divorcées, selon le sexe et le groupe d'âges quinquennal, en 1976 et 1981.

Au cours de cette période, le changement le plus remarquable observé chez les deux sexes et dans tous les groupes d'âges est la diminution du nombre de personnes mariées au profit de celles divorcées. Chez les gens âgés 15 ans et plus, les proportions de célibataires et de personnes veuves étaient pratiquement les mêmes en 1976 et 1981, 31.4% et 31.3% pour les hommes et 24.6% et 24.5% pour les femmes.

Pour les moins de 40 ans, toutefois, la proportion de célibataires s'est accrue tant chez les hommes que chez les femmes. La hausse a été appréciable surtout chez les 20-29 ans. Après 40 ans, la proportion de célibataires a baissé chez les deux sexes et dans tous les groupes d'âges.

Ce fut l'inverse pour la population mariée. Les proportions étaient plus faibles en 1981 qu'en 1976 dans tous les groupes d'âges, jusqu'au groupe des 55-59 ans chez les hommes et jusqu'à celui des 50-54 ans chez les femmes. Après ces âges, elles étaient plus élevées en 1981 qu'en 1976.

Figure – I
Proportions of Single, Married, Widowed and Divorced
by Sex and Age Group, Canada, 1981
Proportions de célibataires, mariés, veufs et divorcés,

The proportion of widowed population was only slightly lower in 1981 than 1976 for every group except 90 years and over.

Sex Ratio

The sex ratios in Table 8 show the disparities between the number of males and females within each marital status category.

On June 1, 1981, there were 123 single males for every 100 single females 15 years of age and over. There are several reasons for this. Among single persons under 30, females marry at an earlier age and at a higher rate than do males. After age 30, single males have higher marriage and mortality rates than females, it is only after 60 that there are more single women than men (see Figure II). Although single females outnumber males in the older age groups, their numbers do not compensate for the larger number of single males under 30 years.(2) Thus in the general population, single men still outnumber single women.

Among the married, the number of males and females was practically equal, at 99.4 males for every 100 females. However, the sex ratios for the youngest and oldest age groups are far from equal (24 males for every 100 females in the 15 to 19 group and 245 males for every 100 females in the 85 to 89 group).

The ratio of men to women is very low among the widowed at all ages. The average ratio is 20.8 males for every 100 females. There are three reasons for this: higher female life expectancies, women marry men older than themselves and after being widowed, have a lower remarriage rate.

(2) For further information on differences in marriage rates by marital status and sex, see K.G. Basavarajappa, Marital Status and Nuptiality in Canada, Statistics Canada, 1971 Census of Canada, Profile Studies: Demographic Characteristics, Catalogue No. 99-704, Ottawa, 1978.

La proportion de personnes veuves n'a diminué que légèrement en 1981 par rapport à 1976, dans tous les groupes d'âges sauf celui des 90 ans et plus.

Rapport de masculinité

Les rapports de masculinité présentés au tableau 8 font voir l'ampleur des disparités qui existent entre les effectifs masculin et féminin au sein d'une même catégorie d'état matrimonial.

Au 1er juin 1981, on comptait 123 hommes célibataires pour 100 femmes célibataires chez les 15 ans et plus. Il y a plusieurs raisons à cela. Chez les célibataires de moins de 30 ans, les femmes se marient plus jeunes et en plus grand nombre que les hommes. Après 30 ans, les hommes célibataires affichent des taux de nuptialité et de mortalité supérieurs à ceux des femmes; ce n'est qu'après 60 ans qu'il y a plus de femmes célibataires que d'hommes célibataires (voir la fiqure II). Cependant, même si les femmes célibataires dépassent en nombre les hommes célibataires dans les groupes d'âges avancé, la différence ne suffit pas à compenser le nombre plus élevé d'hommes célibataires de moins de 30 ans(2). C'est ainsi que dans l'ensemble de la population, l'effectif des hommes célibataires dépasse encore celui des femmes célibataires.

Chez les personnes mariées, le nombre d'hommes et de femmes est pratiquement égal: 99.4 hommes pour 100 femmes. Toutefois, les rapports de masculinité dans le groupe des plus jeunes et dans celui des plus vieux sont loin d'être égaux: 24 hommes pour 100 femmes chez les 15-19 ans et 245 hommes pour 100 femmes chez les 85-89 ans.

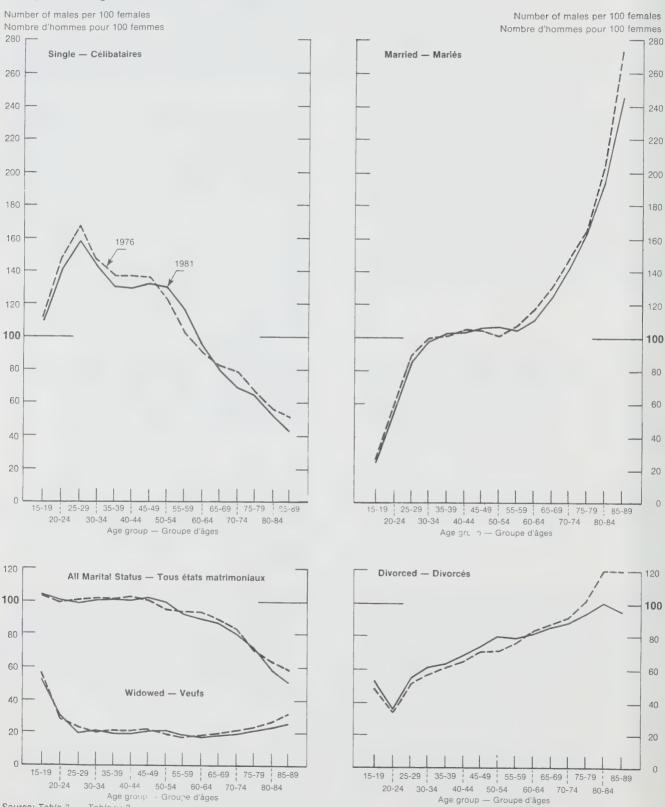

Le rapport de masculinité est très faible chez les personnes veuves de tous les groupes d'âges, le rapport moyen étant de 20.8 hommes pour 100 femmes. Il y a trois raisons à cela: les femmes ont une espérance de vie plus élevée, épousent des hommes plus âgés qu'elles et les veuves affichent un taux de remariage inférieur à celui des hommes.

(2) Pour plus de détails sur la nuptialité différentielle selon l'état matrimonial et le sexe, voir K.G. Basavarajappa, État matrimonial et nuptialité au Canada, Statistique Canada, Recensement du Canada de 1971, Études schématiques: Caractéristiques démographiques, nº 99-704 au catalogue, Ottawa, 1978.

Rapport de masculinité selon l'état matrimonial et le groupe d'âges, Canada, 1976 et 1981

DEFINITIONS

Error of Closure

Difference between the population according to a census and the updated postcensal estimate for the same date.

Intercensal Estimate

Population estimate derived by using data from the censuses preceding and following the year in question.

Postcensal Estimate

Population estimate produced by using data from the most recent census and estimates of the components of demographic change since that last census date.

Marital Status

Indicates the conjugal status, that is whether single, married, widowed or divorced:

Single. Includes persons who have never been married and all persons under 15 years of ane.

Married. Includes persons now married, separated (legally or otherwise) but not divorced and persons living in common-law unions.

Population

Estimated population and population according to the census are both defined as being "the total number of persons whose usual place of residence...was somewhere in Canada, including Canadian government employees stationed abroad and their families, members of Canadian Armed Forces stationed abroad and their families, and crews of Canadian merchant vessels. Not included are government representatives of other countries and their families, attached to the legation, embassy, or other diplomatic body of that country, members of the Armed Forces of other countries stationed in Canada and members of their families who are not citizens of Canada, students attending school in Canada whose usual residence is outside Canada, and residents of another country visiting in Canada temporarily". Dictionary of the 1971 Census Terms, Catalogue No. 12-540, page 28.

DÉFINITIONS

Erreur en fin de période intercensitaire

Différence entre la population donnée par un recensement et l'estimation postcensitaire corrigée à la date du recensement.

Estimation intercensitaire

Estimation de l'effectif de la population obtenue en tenant compte des résultats des deux recensements encadrant l'année considérée.

Estimation postcensitaire

Estimation de l'effectif de la population obtenue en utilisant les résultats du dernier recensement disponible et l'estimation des composantes du changement démographique survenu depuis la date de ce dernier recensement.

ftat matrimonial

Indique la situation conjugale, c'est-à-dire célibataire, marié, veuf et divorcé. Il convient de signaler que:

Célibataire. Comprend les personnes qui n'ont jamais été mariées et toutes les personnes de moins de 15 ans.

Marié. Comprend les personnes actuellement mariées, les personnes séparées légalement ou non mais qui n'ont pas obtenu de divorce et les personnes vivant en union consensuelle.

Population

La population estimée répond à la même définition que celle dénombrée lors du recensement. Il s'agit donc du "nombre total de personnes dont le lieu de résidence habituelle...était quelque part au Canada, y compris les employés du gouvernement canadien postés à l'étranger et leur famille, les membres des Forces armées canadiennes stationnés à l'étranger et leur famille et les équipages des navires marchands canadiens. Ne sont pas compris les représentants officiels des autres pays et leur famille, attachés à la légation, à l'ambassade ou à une autre organisme diplomatique de ces pays. les membres de Forces armées étrangères stationnés au Canada et les membres de leur famille qui ne sont pas citoyens du Canada, les étudiants qui fréquentent l'école au Canada mais dont la résidence habituelle est en dehors du Canada et les résidents d'autres pays en visite temporaire au Canada". Dictionnaire des termes du recensement de 1971, (nº 12-540 au catalogue, page 22).

METHODOLOGY

By definition, intercensal estimates should be compatible with data from the censuses at either end of the five-year period in question. This implies that estimates for marital status should also be compatible for any age and sex or other sub-group being considered. The method to accomplish this consists of two steps.

First, intercensal estimates of the population according to age and sex are derived for each year from 1977 to 1981.(3)

Secondly, the percentage of the population by marital status (single, married, widowed or divorced) is calculated as of June 1 for each year from 1977 to 1980. For this step, the percentage in each marital status for each group or sub-group is taken from the census data for the years 1976 and 1981. For example, 67% of Ontario males 26 years of age were married in 1976 and 62% in 1981. Then to obtain the annual increase, the difference between the figures for the two censuses is divided by five because there are five years between censuses. Between 1976 and 1981, the number of married males aged 26 in Ontario has decreased annually by 1% [62% - 67%] + 5 = -1%. For each year between censuses, the annual increase for a given marital status is added to the percentage of the previous year, beginning with 1976. In the example for those 26 years of age where 67% were married in 1976, the calculation is 66% [that is, 67% -1%] in 1977, 65% in 1978, 64% in 1979, 63% in 1980 and of course, 62% in 1981.

Finally, to derive estimates of the number of married, single, divorced or widowed, the percentages found in step two are applied to the population estimates obtained in step one. For example, in 1977 the estimated number of men aged 26 was 70,300,66% of which would have been married. Thus the estimated number of married men aged 26 was 46,400 ($70,300 \times 66\%$).

MÉTHODOLOGTE

Par définition, les estimations intercensitaires doivent être compatibles avec les données des deux recensements encadrant les années pour les quelles elles sont établies. Ainsi doit-il en être pour les estimations intercensitaires de la population selon l'état matrimonial, quelles que soient les catégories d'âges et de sexe ou les autres sous-groupes considérés. C'est à cette fin que la méthodologie suivante, comportant deux principales étapes, a été utilisée.

Dans un premier temps, des estimations intercensitaires sont établies selon le sexe et l'âge des Canadiens, pour chaque année de la période 1977 à 1981(3).

La deuxième étape consiste à obtenir le pourcentage des individus qui se trouvent, au premier juin des années 1977 à 1980, célibataires, ma-riés, veufs ou divorcés. On recherche donc d'abord, pour chaque groupe ou sous-groupe étudié. quels étaient ces pourcentages aux recensements de 1976 et 1981. Ainsi, parmi les Ontariens âgés de 26 ans, 67% étaient mariés en 1976 et 62% en 1981. Puisqu'il y a cinq ans entre les deux recensements, on divise ensuite par cinq la différence de ces pourcentages afin d'obtenir l'auqmentation annuelle. Entre 1976 et 1981, le groupe d'Ontariens mariés de 26 ans a donc diminué annuellement de 1% [62% - 67%] + 5 = -1%. Pour chacune des années intercensitaires, on ajoute l'augmentation annuelle pour un état matrimonial donné au pourcentage de l'année précédente, en commençant par celui de 1976. Puisqu'en 1976, 67% des Ontariens de 26 ans étaient mariés, 66% [67% - 1%] l'étaient en 1977, 65% en 1978, 64% en 1979, 63% en 1980 et 62% en 1981.

Finalement, pour trouver le nombre d'individus célibataires, mariés, veufs ou divorcés dans un groupe ou sous-groupe donné, on applique les différents pourcentages obtenus à la deuxième étape aux estimations correspondantes fournies à la première. En 1977, on estime à 70,300, le nombre d'hommes âgés de 26 ans, parmi lesquels 66% auraient été mariés. L'effectif des époux âgés de 26 ans sera alors évalué à 46,400 ($70,300 \times 66\%$).

(3) Pour une description détaillée de la méthodologie rattachée à cette étape, on peut consulter les Estimations intercensitaires annuelles de la population selon le sexe et l'âge, Canada et provinces, 1976-1981 (nº 91-518 au catalogue), Statistique Canada, septembre 1983 (deuxième édition).

⁽³⁾ For a detailed description of the methodology involved in this step, consult Intercensal Annual Estimates of the Population by Sex and Age, for Canada and Provinces, 1976-1981, Catalogue No. 91-518, Statistics Canada, September 1983 (Second issue).

The estimates in this publication are subject to a certain margin of error, some of which stem from errors in census data and some of which stem from the estimation methodology employed.

Errors from census figures include coverage errors and response and processing errors. Coverage errors are mainly caused by under-enumeration; the undercoverage rate was practically the same in the 1976 and 1981 Censuses, about 2%. However, it was unevenly distributed by marital status; for example, 1.2% in 1976 and 1981 for married population, 9.3% in 1976 and 5.1% in 1981 for divorced, 2.5% in 1976 and 0.6% in 1981 for widowed and 2.6% in 1976 and 2.9% in 1981 for single (never married) population. (See Text Table II.)

The main response and processing errors stem from non-responses, misinterpretation of questions by the respondents and coding and imputation errors. The response rate for the 1981 Census question on age was 98.9%; on marital status, 98.7%; and on sex 99.2%. For further detail on the total standard error associated with census figures, the publications listed in the reference section may be consulted.

Although it is difficult to measure the errors stemming from estimation methods or data sources other than the censuses, they probably exist and are significant. At each level of detail, additional inaccuracy is introduced. The intercensal population estimates by sex and age themselves contain errors, and the method used to assign marital status categories to them adds new errors. Their significance certainly greater in age groups where the distribution by marital status varies markedly (for example, ages 15 to 34) than in age groups where it is fairly stable (ages 35 to 54).

(4) All citations on the 1981 Census in this section refer to the June 3, 1981 Census data, not to the adjusted June 1, 1981.

Les nombres contenus dans la présente publication sont entachés d'une certaine marge d'imprécision qui provient à la fois des erreurs dues aux données des recensements et des erreurs dues aux méthodologies d'estimation.

Les premières comprennent des erreurs de couverture et des erreurs de réponse et d'exploitation. Les erreurs de couverture sont principalement causées par un sous-dénombrement. Le taux global du sous-dénombrement fut pratiquement le même dans les recensements de 1976 et de 1981, environ 2%. Le sous-dénombrement était cependant inégalement réparti selon l'état matrimonial: par exemple, 1.2% en 1976 et 1981 pour la population mariée 9.3% en 1976 et 5.1% en 1981 pour les personnes divorcées, 2.5% en 1976 et 0.6% en 1981 pour les veufs(ves) et 2.6% en 1976 et 2.9% en 1981 pour les célibataires (personnes jamais mariées). (Voir tableau explicatif II.)

Les principales erreurs de réponse et d'exploitation proviennent des non-réponses, des interprétations erronées de la part des recensés, du codage et de l'imputation. Les taux de réponse aux questions du recensement de 1981 on été de 98.9% pour l'âge, 98.7% pour l'état matrimonial et 99.2% pour le sexe. Pour plus de détails sur l'erreur-type totale des chiffres des recensements, on peut se référer aux publications citées dans la section Références.

Les erreurs provenant des méthodologies d'estimation des sources de données autres que les recensements ont une importance difficilement quantifiable mais non négligeable. À chaque niveau de ventilation se glisse un nouveau coefficient d'imprécision. Les effectifs intercensitaires de la population selon le sexe et l'âge contiennent une certaine erreur de départ. La méthodologie que nous avons utilisée pour leur attribuer des états matrimoniaux ajoute aux nombres ainsi obtenus des erreurs supplémentaires. L'importance de ces erreurs est sûrement plus grande aux âges où la répartition selon l'état matrimonial varie rapidement (par exemple, de 15 à 34 ans) qu'aux âges où elle est plutôt stable (35 à 54 ans).

(4) Toute référence au Recensement de 1981 dans cette section se rapporte aux données du 3 juin 1981 et non pas aux données ajustées au 1^{er} juin 1981.

Finally, the accuracy of the figures is also affected by the very definition of marital status. In Canadian censuses, all persons living in common-law arrangements are considered married. (5) The intercensal estimates contained in this publication are based on actual census data and follow this definition. There is reason to believe that this practice causes a significant transfer to the married category from other marital status categories. For example, there were 5,474,235 married males in Canada as of June 1, 1976. Although the occurence of demographic events between June 1, 1976 and June 1, 1981 would lead one to expect a total of approximately 5,766,800(6) married males as of June 1, 1981, there were 5,956,295 such persons enumerated in the 1981 Census (see Text Table III).

Une dernière limitation des nombres provient de la définition même de la variable état matrimonial. Dans les recensements du Canada, sont aussi considérées comme mariées toutes les personnes vivant en union consensuelle(5). Les estimations intercensitaires contenues dans le présent bulletin sont établies à partir des données des recensements et utilisent la même définition. On a lieu de croire que cette politique entraîne cependant des transferts non négligeables des autres états matrimoniaux vers l'état de marié. Par exemple, au 1^{er} juin 1976 il y avait au Canada 5,474,235 hommes mariés. Alors que le compte des événements démographiques, entre les 1er juin 1976 et 1981, affectant cette population en laissant attendre près de 5,766,800(6) au 1er juin 1981, le recensement de 1981 en a dénombré 5,956,295 (voir tableau explicatif III).

TEXT TABLE III. Error of Closure of the Estimates of Population Aged 15 years and Over by Sex and Marital Status, Canada, June 1, 1981

TABLEAU EXPLICATIF III. Erreur en fin de période intercensitaire des estimations de la population âgée de 15 ans et plus, selon le sexe et l'état matrimonial, Canada, 1er Juin 1981

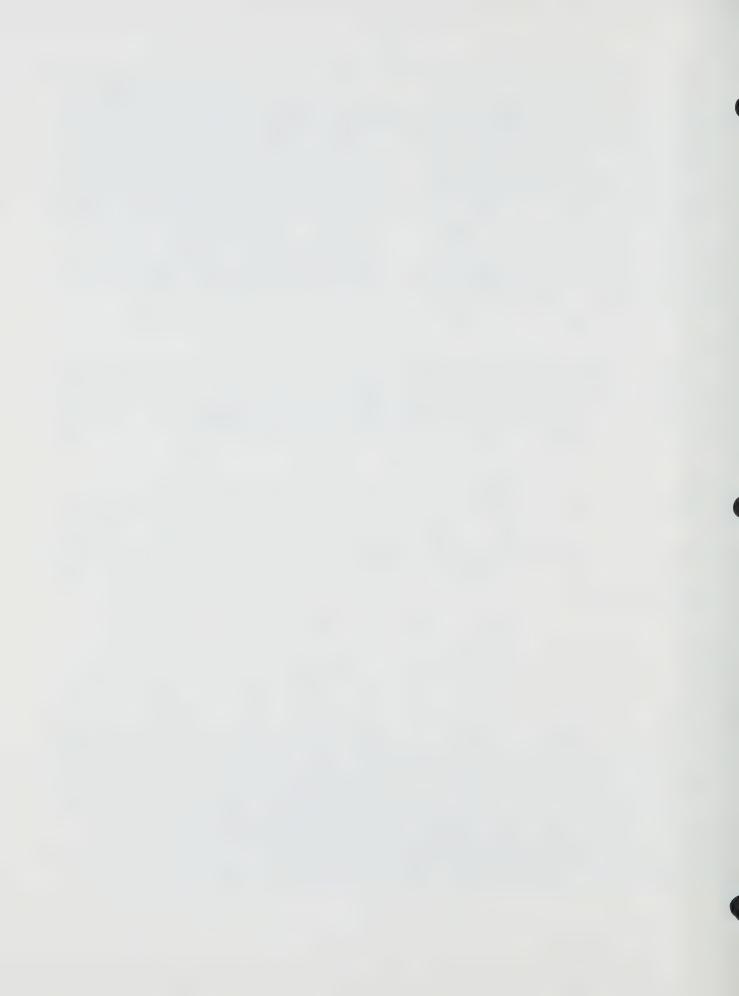

Marital status	Both sexes Sexe réunis	3	Male Hommes		Female Femmes				
Etat matrimonial	Number	Per cent	Number	Per cent	Number	Per cent			
	Nombre	Pourcentage	Nombre	Pourcentage	Nombre	Pourcentage			
All Marital Status - Tous états matrimo- niaux	- 42,081	- 0.22	- 12,027	- 0.13	- 30,054	- 0.31			
Single - Célibataires	220,986	4.21	117,796	4.06	103,190	4.38			
Married - Mariés(es)	- 367,058	- 3.07	- 188,749	3.17	- 178,309	- 2.98			
Widowed - Veufs(ves)	1,929	0.17	3,980	1.99	- 2,051	- 0.21			
Divorced - Divorcés(es)	102,062	20.41	54,946	27.09	47,116	15.85			

Note: The error of closure is equal to the June 1, 1981 updated postcensal estimates minus the 1981 Census count adjusted to June 1. The percentage of error of closure is error of closure divided by the 1981 census count adjusted to June 1 \times 100.

Nota: L'erreur en fin de période est égale à la différence entre l'estimation postcensitaire corrigée de la population au 1^{er} juin 1981 et les chiffres du recensement de 1981 ajustés au 1^{er} juin 1981. Le pourcentage de l'erreur en fin de période est égale à l'erreur en fin de période divisée par les chiffres du recensement de 1981 ajustés au 1^{er} juin x 100. Data in Many Forms...

Statistics Canada disseminates data in a variety of forms. In addition to publications, both standard and special tabulations are offered on computer print-outs, microfiche and microfilm, and magnetic tapes. Maps and other geographic reference materials are available for some types of data. Direct access to aggregated information is possible through CANSIM, Statistics Canada's machine-readable data base and retrieval system.

How to Obtain More Information

Inquiries about this publication and related statistics or services should be directed to:

Des données sous plusieurs formes ...

Statistique Canada diffuse les données sous formes diverses. Outre les publications, des totalisations habituelles et spéciales sont offertes sur imprimés d'ordinateur, sur microfiches et microfilms et sur bandes magnétiques. Des cartes et d'autres documents de référence géographiques sont disponibles pour certaines sortes de données. L'accès direct à des données agrégées est possible par le truchement de CANSIM, la base de données ordinolingue et le système d'extraction de Statistique Canada.

Comment obtenir d'autres renseignements

Toutes demandes de renseignements au sujet de cette publication ou de statistiques et services connexes doivent être adressées à:

Section des estimations démographiques, Division de la démographie,

Statistique Canada, Ottawa, K1A 0T6 (téléphone: 951-2320) ou au centre de consultation de Statistique Canada à:

St. John's	(772-4073)	Winnipeg	(983-4020)

Highlights

- On June 1, 1986, 30.7% of males aged 15 years and over were single, while 64.3% were married, 2.2% were widowed and 2.8% were divorced. The proportion of single and married females was lower, at 24.0% and 61.8% respectively, but the proportion of divorced, and in particular widowed, females was higher, at 4.1% and 10.2% respectively.
- With reference to June 1, 1981, the total number of divorced persons increased over the 5-year period by more than 35%. This increase reached its highest value between the ages of 40 and 59 years for males, and between 35 and 64 years for females. Although significant, growth over the last five years was nevertheless lower than that for the 1976 to 1981 period when, it surpassed 60%.
- The proportion of singles among the total population aged 15 years and over declined slightly between 1981 (27.9%) and 1986 (27.3%), despite an increase among the 20-39 age category (1981, 29.3%; 1986, 32.9%).
- Single males outnumbered their female counterparts. For divorced and particularly, widowed persons, the opposite situation prevailed. With regards to married persons, there were more females than males up to the age of 35. Males were in the majority thereafter with a noteable difference from age 65 years onwards.

Faits saillants

- Au 1er juin 1986, 30.7% des hommes de 15 ans et plus étaient célibataires, 64.3% mariés, 2.2% veufs et 2.8% divorcés. Du côté féminin, on observe une proportion inférieure de célibataires et de mariées (24.0% et 61.8% respectivement), mais une part plus grande de divorcées (4.1%) et surtout de veuves (10.2%).
- Par rapport au 1er juin 1981, le nombre total de personnes divorcées a augmenté de plus de 35%. Cette augmentation atteint les plus fortes valeurs entre 40 et 59 ans chez les hommes et entre 35 et 64 ans chez les femmes. L'accroissement des cinq dernières années, quoiqu'important, est cependant inférieur à celui de 1976 à 1981, alors qu'il avait dépassé les 60%.
- La part des célibataires au sein de la population âgée de 15 ans et plus a légèrement régressé entre 1981 (27.9%) et 1986 (27.3%), malgré une hausse pour la catégorie d'âges 20-39 ans (1981, 29.3%; 1986, 32.9%).
- Les hommes célibataires sont plus nombreux que leurs homologues féminines. Dans le cas des divorcé(e)s et surtout des veuf(ve)s, la situation inverse prévaut. En ce qui concerne les personnes mariées, les femmes sont plus nombreuses jusque vers 35 ans. Par la suite, les hommes deviennent majoritaires, l'écart s'accentuant de façon marquée à partir de 65 ans.

Introduction

Since 1982, Statistics Canada has published postcensal annual estimates of population on June 1 by sex, age and marital status in Catalogue No. 91-210. These estimates, obtained by the component method, were adjusted using the results of the 1986 Census to produce the intercensal estimates.

This report includes in its first part: a glossary of demographic terms used in this publication, a reference to data sources and methodology, an evaluation of the quality of these estimates and a summary analysis of the demographic evolution by age, sex and marital status between 1981 and 1986.

The second part contains statistical tables showing intercensal estimates by sex, age and marital status at June 1 for the years 1981 to 1986. Also included are some common demographic indices such as the population distribution and sex ratios by age group and marital status. Data for the years 1981 and 1986 are, in fact, June 3rd Census counts adjusted to June 1. Moreover, for 1986, data are also corrected to take into account incompletely enumerated Indian reserves and settlements. Data in Tables 1 to 6 of this publication are available on CANSIM, Table 470201.

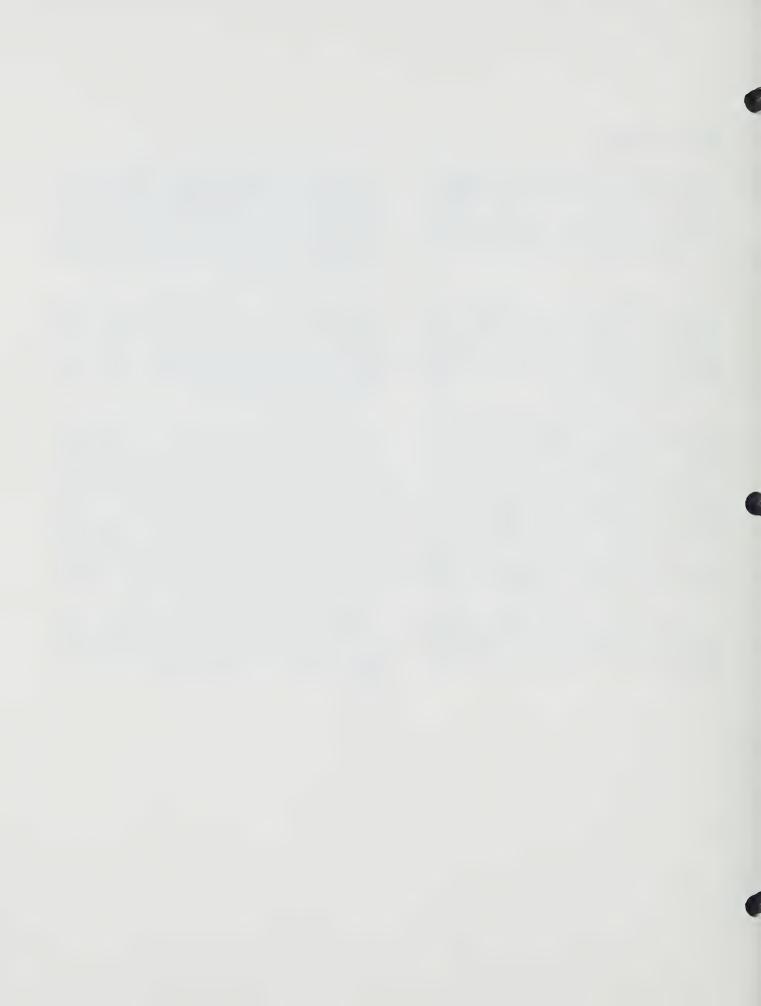

We wish to point out that Statistics Canada has published intercensal estimates by individual years of age since 1971. For the period 1951 to 1970, data are available only by broad age groups.

Depuis 1982, les estimations postcensitaires annuelles de la population au 1^{er} juin selon le sexe, l'âge et l'état matrimonial paraissent dans la publication nº 91-210 au catalogue. Ces estimations pour les années 1982 à 1986, qui sont établies par la méthode des composantes, ont été corrigées pour tenir compte des résultats du recensement de 1986. On obtient ainsi les estimations intercensitaires.

La première partie de ce rapport comprend un court lexique des termes particuliers utilisés dans cette publication, une référence à la méthodologie et aux sources de données, une évaluation de la qualité des présentes estimations et une analyse sommaire de l'évolution démographique selon l'âge, le sexe et l'état matrimonial entre 1981 et 1986.

La seconde partie contient les tableaux statistiques présentant les estimations selon le sexe, l'âge et l'état matrimonial au 1er juin, de même que quelques indices démographiques usuels, tels la répartition de la population et les rapports de masculinité par groupe d'âges quinquennal et état matrimonial. Les données de 1981 et 1986 sont celles des recensements du 3 juin ajustés au 1er juin. De plus, pour les données de 1986, à cet ajustement s'ajoute la correction pour tenir compte des réserves et établissements indiens partiellement dénombrés. Les données figurant aux tableaux 1 à 6 de cette publication sont également disponibles par l'intermédiaire de CANSIM, tableau 470201.

Mentionnons enfin que Statistique Canada publie des estimations intercensitaires selon l'année d'âge depuis 1971. Pour la période de 1951 à 1970, les estimations ne sont disponibles que par grand groupe d'âges.

A Few Definitions

Components of Demographic Change

The factors responsible for population growth and variations in the demographic composition of populations between two points in time. These include: births; deaths; marriages; divorces, and other vital events, as well as migration in its various forms.

Error of Closure

Difference between the population according to a census and the postcensal estimate for the same date.

International Migration

Movement of population between Canada and a foreign country which involves a permanent change in residence. A distinction is made between **immigrants** from other countries who settle in Canada and **emigrants** who leave Canada.

Interprovincial Migration

Movements from one province to another involving a permanent change in residence. A person who takes up residence in another province is an **out-migrant** with reference to his province of origin, and an **in-migrant** with reference to his province of destination.

Marital Status

Indicates the conjugal status, that is whether single, married, widowed or divorced.

Single. Includes persons who have never been married and all persons under 15 years of age.

Married. Includes persons now married, separated (legally or otherwise but not divorced) and persons living in common-law unions.

Although the number of married males and females should be theoretically identical, it is not the case as can be seen in the 1986 Census data which shows, 6,249,120 married males and 6,302,080 married females. The main reasons for this discrepancy (52,960) are:

Census underenumeration. The extent of census underenumeration varies by sex. For example, in 1986, the undercoverage rate for married males was 2.07% whereas that for married females was 1.71%. This differential explains approximately 40% of the total difference.

Quelques définitions

Composantes de l'accroissement démographique

Facteurs responsables de l'accroissement de la population et des changements de la structure démographique de celle-ci, au cours d'une période donnée. Les composantes sont: les naissances, les décès, les mariages, les divorces et autres statistiques de l'état civil, de même que les divers types de migration.

Erreur en fin de période

Différence entre la population donnée par un recensement et l'estimation postcensitaire à la date du recensement.

Migration internationale

Ensemble des déplacements entre le Canada et l'étranger accompagnés d'un changement permanent de résidence. On distingue à cet égard les immigrants, qui viennent s'établir au Canada et les émigrants, qui quittent le Canada.

Migration interprovinciale

Ensemble des déplacements, d'une province vers une autre, accompagnés d'un changement permanent de résidence. Un individu qui effectue un tel déplacement sera un sortant pour sa province d'origine et un entrant pour sa province de destination.

État matrimonial

Indique la situation conjugale. On ne considère que quatre possibilités: célibataire, marié(e), veuf(ve), divorcé(e).

Célibataire. Comprend les personnes qui n'ont jamais été mariées et toutes les personnes de moins de 15 ans.

Marié. Comprend les personnes actuellement mariées, les personnes séparées (légalement ou non mais qui n'ont pas obtenu de divorce) et les personnes vivant en union consensuelle.

Bien que, théoriquement, le nombre de personnes mariées doit être identique pour chacun des sexes, il n'en est pas ainsi tel qu'on peut le constater au recensement de 1986 (6,249,120 hommes mariés et 6,302,080 femmes mariées). Les principales raisons pour cette différence (52,960) sont les suivantes:

<u>Sous-dénombrement</u>. L'importance du sousdénombrement au recensement varie selon le sexe. En 1986, le taux de sous-dénombrement pour les hommes mariés était de 2.07%, alors que celui des femmes mariées était de 1.71%. Cet écart en nombre absolu explique approximativement 40% de la différence observée. International migration.

Between June 1, 1981 and May 31, 1986, 111,266 married males and 124,453 married females arrived in Canada as landed immigrants.

Common-law unions.

Persons who were single, widowed or divorced, but who indicated that they were living in a common-law union at the time of the 1986 Census, were considered to be married persons. This process involved the addition of 425,000 females, but only 412,000 males, to the married population. This resulted in a net transfer of 13,000 excess females to the status of married.

Response errors.

In response to the question on marital status, some married persons absent from home may have declared themselves as single while their spouse reported their marital status as married.

Number of Complete Years Lived

Age at last birthday.

Population

"Estimated population" and "population according to the census" are both defined as being "the total number of persons whose usual place of residence... was somewhere in Canada, including Canadian government employees stationed abroad and their families, members of Canadian Armed Forces stationed abroad and their families, and crews of Canadian merchant vessels. Not included are government representatives of other countries and their families, attached to the legation, embassy, or other diplomatic body of that country, members of the Armed Forces of other countries stationed in Canada and members of their families who are not citizens of Canada, students attending school in Canada whose usual residence is outside Canada, and residents of another country visiting Canada temporarily (Dictionary of the 1971 Census Terms, Catalogue No. 12-540, p. 28).

Population Estimate

(a) Preliminary, Updated and Final Postcensal Population estimate produced by using data from the most recent census and estimates of the components of demographic change since that last census.

Migration internationale.

Du 1er juin 1981 au 31 mai 1986, 111,266 hommes mariés et 124,453 femmes mariées sont entrés au Canada comme immigrants reçus.

Unions consensuelles.

Les personnes célibataires, divorcées et veuves au moment du recensement de 1986 vivant en union libre ont été considérées comme personnes mariées. Cette opération a entraîné l'addition de 425,000 femmes et de seulement 412,000 hommes mariés, soit une différence de 13,000.

Erreurs de réponse.

À la question traitant de l'état matrimonial, certaines personnes mariées absentes de la maison ont pu se déclarer célibataires tandis que leur conjoints à la maison ont indiqué qu'ils étaient mariés.

Âge en années révolues

Âge au dernier anniversaire.

Population

La population estimée répond à la même définition que celle dénombrée lors du recensement. Il s'agit donc du "nombre total de personnes dont le lieu de résidence habituelle... était quelque part au Canada, y compris les employés du gouvernement canadien postés à l'étranger et leur famille, les membres des Forces armées canadiennes stationnés à l'étranger et leur famille et les équipages des navires marchands canadiens. Ne sont pas compris les représentants officiels des autres pays et leur famille, attachés à la légation, à l'ambassade ou à un autre organisme diplomatique de ces pays, les membres des Forces armées étrangères stationnés au Canada et les membres de leur famille qui ne sont pas citoyens du Canada, les étudiants qui fréquentent l'école au Canada mais dont la résidence habituelle est en dehors du Canada et les résidents d'autres pays en visite temporaire au Canada" (Dictionnaire des termes du recensement de 1971, nº 12-540 au catalogue, p. 22).

Estimation de la population

a) Postcensitaire provisoire, mise à jour et définitive Estimation de l'effectif de la population obtenue en utilisant les résultats du dernier recensement disponible et l'estimation de l'accroissement démographique survenu depuis la date de ce dernier recensement.

(b) Intercensal

Population estimate derived by using final postcensal estimates and data from the censuses preceding and following the year in question.

Undercoverage Rate

The ratio expressed as a percentage of the estimated number of persons not enumerated in the census (who were intended to have been enumerated) to the total number that should have been enumerated in the census.

Methodology and Data Sources

The postcensal estimates by age, sex and marital status are obtained by the component method. To census counts adjusted to June 1, we add or subtract demographic events (births. deaths, marriages, divorces and immigration) or estimated events (interprovincial migration. emigration and new widowhoods) occurring between the last census and the reference period of the estimate of population. When the results of the next census are published, our postcensal estimates by age and sex are adjusted to make them compatible with the two adjacent censuses. Marital status is then allocated from these two censuses. This is how we obtain our intercensal estimates. For more detailed information regarding sources of data and population estimation methods for intercensal data, see the publication "Population Estimation Methods, Canada" catalogue No. 91-528E, Chapter III, page 35.

Quality of Estimates

The population figures presented in this publication contain certain inaccuracies stemming from, on the one hand, 1981 and 1986 Census data and, on the other hand, other data sources and the estimation methods.

Errors in Census Data

The errors attributable to census data include (a) coverage errors, (b) response and processing errors and (c) errors due to differences in concept definitions.

b) Intercensitaire

Estimation de l'effectif de la population, obtenue en utilisant les estimations postcensitaires définitives et les résultats des deux recensements encadrant l'année considérée

Taux de sous-dénombrement

Rapport, exprimé en pourcentage, du nombre estimé de personnes qui n'ont pas été recensées (mais étaient visées par le recensement) à celui de l'ensemble des personnes visées par le recensement.

Méthodologie et sources des données

Les estimations postcensitaires selon l'âge, le sexe et l'état matrimonial s'obtiennent par la méthode des composantes: aux effectifs de la population fournis par le recensement, ajustés au 1er juin, on ajoute ou retranche les événements démographiques enregistrés (naissances, décès, mariages, divorces et immigration) ou estimés (migration interprovinciale, émigration et personnes nouvellement en veuvage) survenus entre le dernier recensement et la date de référence de l'estimation. Lorsque les résultats du recensement suivant deviennent disponsibles, on corrige d'abord les estimations postcensitaires selon l'âge et le sexe afin de les rendre cohérentes avec les deux recensements qui les encadrent, puis on leur attribue un état matrimonial à partir des données de ces deux recensements. On obtient ainsi les estimations intercensitaires. Pour plus d'information concernant les sources de données et les méthodes d'estimation des intercensitaires, le lecteur peut consulter la publication "Méthodes d'estimation de la population, Canada", nº 91-528F au catalogue, chapitre III, page 35.

Qualité des estimations

Les effectifs de population publiés ici comportent une certaine marge d'imprécision qui provient d'une part des données des recensements de 1981 et 1986 et d'autre part des autres sources de données et des méthodes d'estimation.

Erreurs des données du recensement

Parmi les erreurs imputables aux données du recensement, on retrouve a) les erreurs de couverture, b) les erreurs de réponse et d'exploitation, c) les erreurs provenant des différences dans les définitions de certains concepts.

(a) Coverage errors are primarily the result of undercoverage (little information exists on overcoverage, and it is generally considered negligible. A study was conducted following the 1986 Census, however, and results should make quantification of this phenomenon possible). The undercoverage rate varies not only by province, but also by sex, age and marital status, as well as from census to census (see Text Tables I, II and III). Such differential undercoverage inevitably leads to biases in the estimates. For example, to estimate the male population aged 20-24 on June 1, 1986, the population aged 15-19 in 1981 was used as a base. All the demographic events affecting these cohorts between 1981 and 1986 were then factored in. In 1981, the undercoverage rate for the 15-19 age group was about 3%; in 1986, the same cohorts, who were then between the ages of 20 and 24, had an undercoverage rate of 11%. Consequently, even if the components accurately reflected the events occurring to that cohort during the 5-year interim, the 1986 estimate of the number of persons aged 20-24 would be 8% higher than the number counted in the 1986 Census.

Les erreurs de couverture sont causées principalement par le sous-dénombrement (peu d'information existe sur le sur-dénombrement et il est généralement considéré comme négligeable. Les résultats d'une étude menée suite au recensement de 1986 devraient cependant permettre de quantifier le phénomène). L'importance du taux de sous-dénombrement varie non seulement d'une province à l'autre, mais également suivant le sexe. l'âge et l'état matrimonial, de même que d'un recensement à l'autre (voir les tableaux explicatifs I, II et III). Ce sous-dénombrement différentiel entraîne inévitablement des biais dans les estimations: par exemple, pour estimer la population masculine âgée de 20-24 ans au 1er juin 1986, on a utilisé comme point de départ la population âgée de 15-19 ans en 1981, puis on a tenu compte des événements démographiques perturbateurs survenus de 1981 à 1986 et affectant ces cohortes. Or, le taux de sous-dénombrement du groupe d'âges 15-19 ans en 1981 était d'environ 3%, tandis qu'il atteignait 11% pour ces cohortes qui, en 1986, étaient âgées de 20-24 ans. Par conséquent, même si les composantes utilisées représentaient exactement ce qui s'est passé, les effectifs estimés des personnes âgées de 20-24 ans seraient supérieurs de 8% à l'effectif recensé en 1986.

TEXT TABLE I. Estimated Population Undercoverage Rates, by Province, 1981 and 1986 Censuses

TABLEAU EXPLICATIF I. Estimation du taux de sous-dénombrement de la population selon la province, recensements de 1981 et de 1986

- (b) The principal response and processing errors are non-response, misinterpretation by respondents, coding errors and incorrect non-response imputation. For example, the response rate in the 1986 Census was 98.9% for the question on sex, 98.8% on age and 98.4% on marital status.
- (c) The statistics on deaths, marriages, divorces. new widowhoods and immigration refer to legal marital status (married, widowed, divorced and single). The census, on the other hand, uses a more practical definition, closer to the actual situation. Thus, in the census, the "married" category includes people who are living together (common-law marriages and so on). The census also regards all persons under 15 years of age as single (never-married). These conceptual differences, and more particularly the phenomenon of common-law unions, are probably responsible for the more significant deviations observed between census figures and postcensal estimates of population by marital status. 1 However, a study is presently being conducted concerning the possibility of taking into account the formation or dissolution of common-law unions.

Errors in Other Data Sources and Methodology

Errors due to estimation methodologies and data sources other than censuses are difficult to quantify but not insignificant. It should be pointed out that errors in some components (births or emigration) may have a greater impact on a given age group, but do not affect at all the quality of the intercensal estimates by marital status. Rather, in that latter case, the bias comes from the linear interpolation of the census data used to derive the annual distribution by marital status of the population. The possible limitation of this method is that it cannot reflect the annual fluctuations occurring during the period.

Despite this, given the size of the errors observed at the end of the 1981-1986 intercensal period for total population and the population by age and sex (as indicated in Text Tables IV and V), and given the method used to produce the present intercensal estimates, they should have an acceptable degree of reliability.

- b) Les principales erreurs de réponse et d'exploitation peuvent provenir des non-réponses, des interprétations erronées de la part des recensés, du codage ou de l'imputation des non-réponses. À titre d'exemple, les taux de réponse aux questions du recensement de 1986 ont été de 98.9% pour le sexe, 98.8% pour l'âge et 98.4% pour l'état matrimonial.
- c) Les chiffres sur les décès, les mariages, les divorces. les entrées en veuvage et l'immigration font référence à l'état matrimonial légal: marié, veuf, divorcé et célibataire. Le recensement utilise plutôt une définition pratique plus proche de la situation de fait. Ainsi au recensement, la catégorie "marié(e)s" comprend les personnes vivant en situation de couple (unions consensuelles, etc.). Le recensement considère aussi toutes les personnes de moins de 15 ans comme célibataires (jamais mariées). Ces différences conceptuelles, et plus particulièrement le phénomène des unions consensuelles sont probablement responsables des écarts les plus importants observés entre les chiffres du recensement et les estimations postcensitaires de la population selon l'état matrimonial. Toutefois. une étude est présentement en cours concernant la possibilité de tenir compte des formations et dissolutions des unions consensuelles.

Erreurs des autres sources de données et de la méthodologie

Les erreurs provenant de la méthodologie d'estimation et des sources de données autres que les recensements ont une importance difficilement quantifiable, mais non négligeable. Mentionnons notamment que des erreurs portant sur certaines composantes (naissances ou émigration, par exemple) peuvent affecter davantage certains groupes d'âges, mais n'ont aucune influence sur la qualité des estimations intercensitaires selon l'état matrimonial. En effet, dans ce dernier cas, l'erreur provient de l'interpolation linéaire des données des recensements de 1981 et 1986 afin d'établir les répartitions annuelles par état matrimonial de la population. Le biais possible de cette méthode est qu'elle ne peut tenir compte des fluctuations annuelles survenues durant la période.

Malgré tout, les présentes estimations devraient avoir un niveau de fiabilité acceptable, compte tenu des erreurs observées à la fin de la période intercensitaire 1981-1986 pour la population totale et selon l'âge et le sexe (voir les tableaux explicatifs IV et V) et compte tenu de la méthode utilisée pour produire les intercensitaires.

The difference does not affect the intercensal estimates by marital status since this variable is derived using only census data.

Cette différence ne touche pas les estimations intercensitaires selon l'état matrimonial puisque seules les données du recensement sont utilisées pour cette variable.

Summary analysis

On June 1st, 1986, there were 19,944,500 individuals aged 15 years and over in Canada, representing 78.7% of the total population. This is in contrast to the 18,860,200 persons, or 77.5% of the population, who were in this age group on June 1, 1981. In 1986, males aged 15 years and over accounted for 9,735,100 persons (or 48.8% of the adult population), of which 30.7% were single, 64.3% were married, 2.2% were widowed, and 2.8% were divorced. Females in the same age group slightly out-numbered males (10,209,500 or 51.2%). Among females, 24.0% were single, 61.8% were married, 10.2% were widowed and 4.0% were divorced.

Between June 1, 1981 and June 1, 1986, the number of divorced persons increased by 36.7% for males, and by 39.2% for females (see Text Table VI). This increase, however, was far lower than that registered in the preceding five-year period, when the proportions were 70.4% and 62.0%, respectively. The number of widowers grew by 5.9%, while that of widows increased by 8.6%. The number of married males increased by 5.0%, while that of married females rose by 5.3%. In the single category, the number of males aged 15 years and over rose by 3.2%, while that for females increased by 3.8%. For each marital status, the growth registered in 1981-86 was not as significant as that seen in the 1976-81 period.

Analyse sommaire

Au 1er juin 1986, 19,944,500 individus étaient âgés de 15 ans et plus, ce qui représentait 78.7% de l'ensemble de la population du Canada, comparativement à 18,860,200, ou 77.5%, au 1er juin 1981. La population masculine de 15 ans et plus, en 1986, comptait 9,735,100 personnes (ou 48.8% de la population adulte), dont 30.7% étaient célibataires, 64.3 mariés, 2.2% veufs et 2.8% divorcés. Les femmes de ce même groupe d'âges surpassaient légèrement les hommes en effectif (10,209,500 ou 51.2%) et 24.0% d'entre elles étaient célibataires, 61.8% mariées, 10.2% veuves et 4.1% divorcées.

Entre le 1er juin 1981 et le 1er juin 1986, le nombre de personnes divorcées a grimpé de 36.7% chez les hommes et de 39.2% chez les femmes (tableau explicatif VI). Cet accroissement sensible est cependant largement inférieur à celui enregistré lors du lustre précédent alors que ces deux chiffres atteignaient 70.4% et 62.0% respectivement. Le nombre de veufs, quant à lui, a crû de 5.9%, tandis que celui des veuves progressait de 8.6%. Les hommes mariés ont vu leur effectif gagner 5.0% et celui des femmes mariées, 5.3%. La catégorie des célibataires âgés de 15 ans et plus, enfin, s'est accrue de 3.2% pour le sexe masculin et de 3.8% du côté féminin. Pour chacun des états matrimoniaux, la croissance enregistrée en 1981-86 s'est avérée moins importante que celle de la période 1976-81.

Source: Tables 1 and 6. - Tableaux 1 et 6.

Marital Status and Age Groups

In 1986, the proportion of married males remained the same as in 1981 (64.3%), but there were proportionately fewer married females in 1986 than in 1981 (61.8% vs. 62.4%). An analysis by age group demonstrates that for the group aged 15-49 years, the percentage of married persons declined for males as well as for females.

From 1981 to 1986, the demographic weight of single males and females aged 15 years and over decreased slightly, going from 31.3% to 30.7% for males, and from 24.5% to 24.0% for females. In total contrast, an increase in single persons was registered for both sexes in the age group 20-39.

The widowed category proved to be the most stable during the 1981-1986 period (2.2% for widowers and about 10% for widows in both 1981 and 1986). This stability was also observed during the previous 5-year period.

Between the last two censuses, the proportion of divorced males and females increased (from 2.2% to 2.8% for males, and from 3.1% to 4.1% for females). The age groups mainly affected by these increases were the 40-59 group for males, and the 35-64 group for females.

Sex Ratio by Marital Status

Sex ratios (the number of males per 100 females) show the degree of disparity between males and females for a given marital status (see Figure I).

État matrimonial et groupe d'âges

En 1986, la proportion des hommes mariés était la même qu'en 1981, soit 64,3%. Les femmes mariées, quant à elles, étaient proportionnellement un peu moins nombreuses en 1986 qu'en 1981 (61.8% contre 62.4%). L'analyse des données selon le groupe d'âges montre que chez les 15-49 ans, le pourcentage des personnes mariées a diminué, tant pour les hommes que pour les femmes.

Le poids des célibataires masculins et féminins âgés de 15 ans et plus, quant à lui, a légèrement régressé, passant de 31.3% à 30.7% de 1981 à 1986, chez les hommes, et de 24.5% à 24.0% du côté féminin. À l'intérieur du groupe d'âges 20-39 ans cependant, on constate la tendance inverse, alors que le pourcentage des célibataires est à la hausse (hommes et femmes).

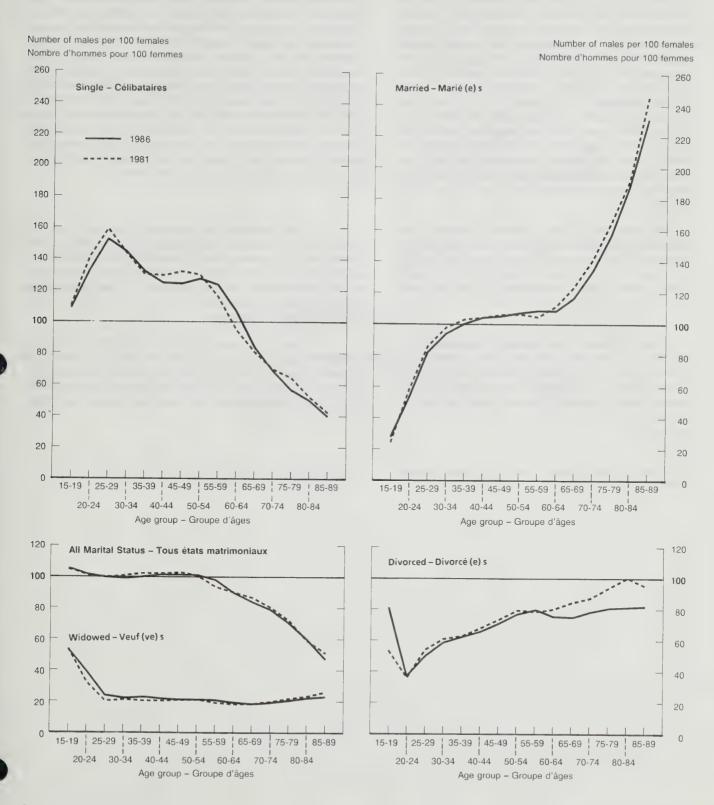

La catégorie des veuf(ve)s est celle qui a démontré la plus grande stabilité au cours de la période 1981-1986 (2.2% pour les veufs et près de 10% pour les veuves en 1981 et en 1986). On avait également observé cette stabilité au lustre précédent.

Entre les deux derniers recensements, la proportion des hommes et des femmes divorcés a augmenté (de 2.2% à 2.8% pour le sexe masculin et de 3.1% à 4.1% pour le sexe féminin). Au niveau des groupes d'âges, on observe que les augmentations touchent principalement le groupe des 40-59 ans chez les hommes et des 35-64 ans chez les femmes.

Rapport de masculinité selon l'état matrimonial

Les rapports de masculinité font voir l'ampleur des disparités qui existent entre les effectifs masculins et féminins au sein d'une même catégorie d'état matrimonial (voir figure I).

Sex Ratio by Marital Status and Age Group, Canada, 1981 and 1986
Rapport de masculinité selon l'état matrimonial et le groupe d'âges, Canada, 1981 et 1986

On June 1, 1986, the single population age 15 years and over had a sex ratio of 122.2, and this preponderance of males was present in every category up to the age of 65. Predictably, for the whole of married persons, the number of males and females was almost identical, with a sex ratio of 99.2.2 Nevertheless, this value varied considerably when distributed by age. Up to the age group 30-34, there were fewer married males than females, and the lowest ratio was found among those aged 15-19 years (27.8 in 1986). The sex ratio increases with age, and reaches 231.2 for the 85-89 year olds, and approximately 300 for the 90-plus age group. The high number of elderly married males compared to married females is essentially attributable to the fact that married men are generally older than their spouse.

The sex ratio in the widowed category has remained relatively stable, oscillating around 20 males per 100 females. Excess male mortality, combined with a lower mean age for female spouses and a lower proportion of widows who remarry, can explain this situation.

Finally, the sex ratio among divorced persons was 67.0 in 1986, whereas five years previously, it was 68.2. Consequently, there were more divorced females than males due to the fact that, among other reasons, divorced females do not remarry as frequently as do their male counterparts.

Au 1er juin 1986, on comptait, parmi les célibataires de 15 ans et plus, 122.2 hommes pour 100 femmes. Ce n'est qu'à partir de 65 ans que l'on observait moins d'hommes que de femmes chez les célibataires. Chez l'ensemble des personnes mariées, comme on pouvait s'y attendre, le nombre d'hommes et de femmes est presque identique, puisque le rapport de masculinité vaut 99.2.2 Néanmoins, cet indice varie beaucoup selon l'âge. Jusqu'au groupe d'âges 30-34 ans, il est inférieur à 100, sa valeur la plus faible étant atteinte à 15-19 ans (27.9 en 1986). Il augmente avec l'âge pour atteindre 231.2 chez les 85-89 et environ 300 au groupe d'âges 90 ans et plus. Le nombre élevé d'hommes mariés par rapport aux femmes mariées chez les personnes âgées s'explique essentiellement par le fait que les hommes mariés sont, en moyenne, plus âgés que leur conjointe.

En ce qui concerne la catégorie des veuf(ve)s, le rapport de masculinité est demeuré assez stable et peu élevé, oscillant autour des 20 hommes pour 100 femmes. La surmortalité masculine, combinée a un âge moyen moins élevé chez les conjointes et à une proportion moins grande de femmes veuves qui se remarient, expliquent cette situation.

Le rapport de masculinité des divorcé(e)s, enfin, s'établissait à 67.0 en 1986, alors que cinq ans auparavant, il valait 68.2. On note donc, ici aussi, plus de femmes que d'hommes divorcés, à cause, entre autres, du fait que les divorcées se remarient moins que leurs homologues masculins.

² For the difference between the number of married females and males, see page 9.

² Au sujet de la différence entre les effectifs des hommes et des femmes mariés, voir la page 9.

Statistical Tables

Estimates by single year of age for population aged 45 years and over are available upon request.

Tableaux Statistiques

Les estimations par année d'âge à compter de 45 ans sont disponibles sur demande.

BIRTH, DEATH, MARRIAGE, DIVORCE

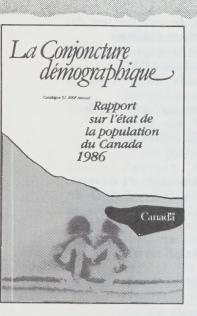

Factors like these are explored in the Report on the Demographic Situation in Canada, 1986.

Using the latest demographic data, this report updates its well received predecessor. It is a dynamic portrait of Canada and her people, and provides special analytical sections on subjects like:

- language
- · fertility and childbearing
- causes of mortality
- interprovincial migration

For the best insight into Canada's demographic scene, choose the Report on the Demographic Situation in Canada, 1986.

Catalogue 91-209E \$15.00 in Canada, \$16.50 other countries, 138 pages.

NAISSANCES, DÉCÈS, MARIAGES, DIVORCES...

Des événements tels que ceux-ci font l'objet du Rapport sur la situation démographique au Canada, 1986.

Réalisé à partir des plus récentes données démographiques disponibles, ce rapport constitue une version à jour de la publication originale, qui avait été très bien accueillie. Il présente un portrait dynamique du Canada et de sa population et contient des analyses sur des sujets comme:

- la langue;
- · la fécondité et la maternité;
- les causes de mortalité;
- la migration interprovinciale.

Afin de mieux saisir la réalité démographique canadienne, procurez-vous le Rapport sur la situation démographique au Canada, 1986

BABY-BOOM TO BABY-BUST

CROISSANCE ET DÉCLIN

DE LA FÉCONDITÉ

A GENERATION IN JEOPARDY

With an all-time low average of 1.7 births per woman, there is no assurance we can replace the present generation. In fact, many Canadians are foregoing parenthood altogether.

Covering a number of issues on the declining birth rate, **Fertility in Canada: From Baby-boom to Baby-bust** focuses on the implications of shrinking population growth.

TOPICS OF INTEREST

The prevailing baby-bust is examined in seven chapters, including such subjects as:

- late parenting, childlessness
- videspread sterilization, contraception, abortion opulation policies in an international perspective
- change in the age structure and the effects on various activities (education, consumption patterns, consumer spending, social security and the labour force)
- working mothers can the demands of two jobs be reconciled?

REPRINT!

UNE GÉNÉRATION EN DANGER

Le nombre moyen d'enfants par femme ayant chuté au plus bas niveau jamais enregistré, soit 1.7, le remplacement de la génération actuelle n'est guère garanti. En fait, de nombreux Canadiens renoncent à avoir des enfants.

La publication intitulée **La fécondité au Canada: Croissance et déclin** analyse un certain nombre de questions relatives au faible taux de fécondité ainsi que les conséquences du ralentissement de la croissance de la population.

THÈMES

La réduction actuelle de la natalité fait l'objet de sept chapitres traitant de sujets comme:

- le report des naissances et l'infécondité;
- la tendance généralisée à la stérilisation, à la contraception et à l'avortement;
- les changements dans la structure par âge et leurs répercussions sur l'éducation, la consommation, les dépenses des consommateurs, la sécurité sociale et la population active;
- les politiques démographiques selon une perspective internationale:
- la possibilité pour les mères actives d'occuper deux emplois à la fois.

RÉIMPRESSION

Vous pouvez commander **La fécondité au Canada: Croissance et déclin** en remplissant le bon de commande ci-joint ou en écrivant à Vente des publications, Statistique Canada, Ottawa (Ontario), K1A 0T6. Population Estimation Methods

Population Estimation Methods, Canada provides a detailed yet lucid coverage of the procedures formulae and data used to generate the entire range of Statistics Canada's population estimates.

Major topics covered in its seven chapters are: emigration, internal migration, intercensal estimates, postcensal estimates of the total population, postcensul estimates by sex, age and marital status, local area estimates and family estimates.

Graphs, charts and tables, along with a glossary of principal terms and symbols make, **Population Estimation Methods, Canada** an easy-to-use reference for anyone using population data or an excellent text for students and professors in the social sciences.

Catalogue #91-528E \$25.00 in Canada \$26.50 other countries 117 pages

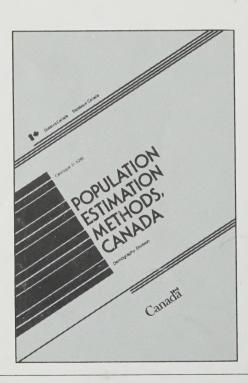

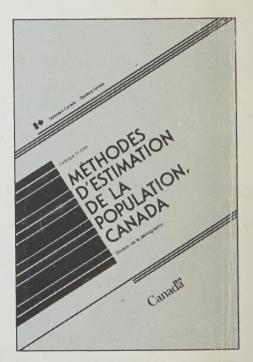

Méthodes d'estimation de la population, Canada fournit une description claire et détaillée des formules et des sources de données utilisées pour produire les estimations de population à Statistique Canada.

Les sujets discutés dans les sept chapitres sont: émigration, migration interne, estimations intercensitaires, estimations postcensitaires de la population totale, estimations postcensitaires selon le sexe, l'âge et l'état matrimonial, estimations de la population infraprovinciale et des familles.

Des graphiques, tableaux et un glossaire des principaux termes et symboles rendent **Méthodes d'estimation de la population, Canada** facile d'emploi pour tous les utilisateurs des données de population et en font un excellent ouvrage de consultation pour les étudiants et les professeurs en sciences sociales.
